U.S. Brand NamesCal-CYUM [OTC]; Caltrate® 600+ Soy™ [OTC]; Caltrate® 600+D [OTC]; Caltrate® ColonHealth™ [OTC]; Chew-Cal [OTC]; Liqua-Cal [OTC]; Os-Cal® 500+D [OTC]; Oysco 500+D [OTC]; Oysco D [OTC]; Oyst-Cal-D 500 [OTC]; Oyst-Cal-D [OTC]

Pharmacologic CategoryCalcium Salt; Electrolyte Supplement, Oral; Vitamin, Fat Soluble

Use: Labeled IndicationsDietary supplement, antacid

Dosing: AdultsCalcium supplement, hyperphosphatemia: Oral: Refer to individual monographs for dietary reference intake.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentUse caution in severe renal impairment.

Administration: OralAdminister, preferably with food, 2 hours before or after other medications.

Dietary ConsiderationsTake with food to minimize GI upset. Some products may contain phenylalanine (avoid use in phenylketonurics), tartrazine, gluten, and/or soy.

ContraindicationsHypersensitivity to any component of the formulation; hypophosphatemia, hypercalcemia, evidence of vitamin D toxicity; history of kidney stones

Warnings/Precautions

Concerns related to adverse effects:

- Gastrointestinal effects: Constipation, bloating, and gas are common with calcium supplements (especially carbonate salt).

Disease-related concerns:

- Achlorhydria: Calcium absorption is impaired in achlorhydria; common in elderly, use an alternate salt (eg, citrate) and administer with food.
- Hypoparathyroid disease: Hypercalcemia and hypercalciuria are most likely to occur in hypoparathyroid patients receiving high doses of vitamin D.
- Kidney stones (calcium-containing): Use caution when administering calcium supplements to patients with a history of kidney stones.
- Renal impairment: Use with caution in patients with renal failure to avoid hypercalcemia; frequent monitoring of serum calcium and phosphorus is necessary.

Concurrent drug therapy issues:

- Minerals/other oral drugs: Calcium administration interferes with absorption of some minerals and drugs; use with caution.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.
- Shellfish: Some products may be derived from shellfish.
- Soy: Some products may contain soy.
- Tartrazine: Some products may contain tartrazine.

Other warnings/precautions:

- Absorption: Taking calcium (≤500 mg) with food improves absorption.

Pregnancy ConsiderationsAvailable evidence suggests safe use during pregnancy.

Breast-Feeding ConsiderationsAvailable evidence suggests safe use during lactation.

Adverse ReactionsFrequency not defined; also see individual agents

Central nervous system: Headache

Endocrine & metabolic: Hypercalcemia, hypercalciuria

Gastrointestinal: Gastrointestinal discomfort

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis).

Food: Food may increase calcium absorption. Calcium may decrease iron absorption. Bran, foods high in oxalates, or whole grain cereals may decrease calcium absorption.

Monitoring ParametersMonitor serum calcium (particularly if used in patients with severe renal impairment)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse/toxic effects. Assess knowledge/teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsMonitor serum calcium (particularly if used in patients with severe renal impairment)

Patient EducationFollow instructions for dosing. Take with a full glass of water or juice 1-2 hours before any iron supplements and 1-3 hours after meals or other medications. Avoid alcohol, other antacids, caffeine, or other calcium supplements, unless approved by prescriber. You may experience constipation (increased exercise, fluids, fiber, or fruit may help) or dry mouth (sucking lozenges or hard candy may help). Report severe, unresolved GI disturbances and unusual emotional liability (mood swings). **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel: Calcium 500 mg and vitamin D 500 int. units; calcium 600 mg and vitamin D 100 int. units; calcium 600 mg and vitamin D 200 int. units

Liqua-Cal: Calcium 600 mg and vitamin D 200 int. units [contains beeswax, lecithin, and soybean oil]

Tablet: Calcium 250 mg and vitamin D 125 int. units; calcium 500 mg and vitamin D 125 int. units; calcium 500 mg and vitamin D 200 int. units; calcium 600 mg and vitamin D 125 int. units; calcium 600 mg and vitamin D 200 int. units

Caltrate® 600+D: Calcium 600 mg and vitamin D 200 int. units [contains soybean oil]

Caltrate® 600+ Soy™: Calcium 600 mg and vitamin D 200 int. units [contains soy isoflavones 25 mg]

Caltrate® ColonHealth™: Calcium 600 mg and vitamin D 200 int. units [contains soybean oil]

Oysco D: Calcium 250 mg and vitamin D 125 int. units

Oysco 500+D: Calcium 500 mg and vitamin D 200 int. units [contains tartrazine]

Oyst-Cal-D: Calcium 250 mg and vitamin D 125 int. units [sodium free, sugar free; contains tartrazine]

Oyst-Cal-D 500: Calcium 500 mg and vitamin D 200 int. units [sodium free, sugar free; contains tartrazine]

Tablet, chewable: Calcium 500 mg and vitamin D 100 int. units; Calcium 600 mg and vitamin D 400 int. units

Os-Cal® 500+D: Calcium 500 mg and vitamin D 400 int. units [sugar free; contains phenylalanine; light lemon flavor]

Wafer, chewable:

Cal-CYUM: Calcium 519 mg and vitamin D 150 int. units (50s) [dye free; vanilla flavor]

Chew-Cal: Calcium 333 mg and vitamin D 40 int. units (100s, 250s)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Index TermsVitamin D and Calcium Carbonate

Calfactant

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(kaf AKT ant)
U.S. Brand NamesInfasurf®
Pharmacologic CategoryLung Surfactant
Use: Labeled IndicationsPrevention of respiratory distress syndrome (RDS) in premature infants at high risk for RDS and for the treatment ("rescue") of premature infants who develop RDS

Prophylaxis: Therapy at birth with calfactant is indicated for premature infants <29 weeks of gestational age at significant risk for RDS. Should be administered as soon as possible, preferably within 30 minutes after birth.

Treatment: For infants ≤72 hours of age with RDS (confirmed by clinical and radiologic findings) and requiring endotracheal intubation.

Dosing: PediatricPrevention or treatment of RDS in premature infants: Intratracheal administration **only**: Each dose is 3 mL/kg body weight at birth; should be administered every 12 hours for a total of up to 3 doses
Administration: OtherShould be administered intratracheally through an endotracheal tube. Dose is drawn into a syringe from the single-use vial using a 20-gauge or larger needle with care taken to avoid excessive foaming. Should be administered in two aliquots of 1.5 mL/kg each. After each aliquot is instilled, the infant should be positioned with either the right or the left side dependent. Administration is made while ventilation is continued over 20-30 breaths for each aliquot, with small bursts timed only during the inspiratory cycles. A pause followed by evaluation of the respiratory status and repositioning should separate the two aliquots.
StorageGently swirling or agitation of the vial of suspension is often necessary for redispersion. **Do not shake.** Visible flecks of the suspension and foaming under the surface are normal. Calfactant should be stored at refrigeration (2°C to 8°C/36°F to 46°F). Warming before administration is not necessary. Unopened and unused vials of calfactant that have been warmed to room temperature can be returned to the refrigeration storage within 24 hours for future use. Repeated warming to room temperature should be avoided. Each single-use vial should be entered only once and the vial with any unused material should be discarded after the initial entry.
Warnings/Precautions

Concerns related to adverse effects:

- Transient adverse effects: Transient episodes of bradycardia, decreased oxygen saturation, endotracheal tube blockage or reflux of calfactant into endotracheal tube may occur. Discontinue dosing procedure and initiate measures to alleviate the condition; may reinstitute after the patient is stable.

Other warnings/precautions:

- Administration: For intratracheal administration only.

- Monitoring: Produces rapid improvements in lung oxygenation and compliance that may require frequent adjustments to oxygen delivery and ventilator settings.

- Trained personnel: Rapidly affects oxygenation and lung compliance; restrict use to a highly-supervised clinical setting with immediate availability of clinicians experienced in intubation and ventilatory management of premature infants.

Adverse Reactions

Cardiovascular: Bradycardia (34%), cyanosis (65%)

Respiratory: Airway obstruction (39%), reflux (21%), requirement for manual ventilation (16%), reintubation (1% to 10%)

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersFollowing administration, patients should be carefully monitored so that oxygen therapy and ventilatory support can be modified in response to changes in respiratory status.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, intratracheal [preservative free; calf lung derived]:

Infasurf®: 35 mg/mL (3 mL, 6 mL)

Generic AvailableNo
Mechanism of ActionEndogenous lung surfactant is essential for effective ventilation because it modifies alveolar surface tension, thereby stabilizing the alveoli. Lung surfactant deficiency is the cause of respiratory distress syndrome (RDS) in premature infants and lung surfactant restores surface activity to the lungs of these infants.
Pharmacodynamics/KineticsNo human studies of absorption, biotransformation, or excretion have been performed
Pharmacotherapy PearlsEach mL = 35 mg total phospholipids (including 26 mg phosphatidylcholine, of which 16 mg is desaturated phosphatidylcholine) and 0.65 protein (including 0.26 mg SP-B)
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(kan de SAR tan & hye droe klor oh THYE a zide)

U.S. Brand NamesAtacand HCT®

Canadian Brand NamesAtacand® Plus

Pharmacologic CategoryAngiotensin II Receptor Blocker; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension; combination product should not be used for initial therapy

Dosing: AdultsHypertension, replacement therapy: Oral: Combination product can be substituted for individual agents; maximum therapeutic effect would be expected within 4 weeks

Usual dosage range:

Candesartan: 16-32 mg/day, given once daily or twice daily in divided doses

Hydrochlorothiazide: 12.5-25 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentSerum levels of candesartan are increased and the half-life of hydrochlorothiazide is prolonged in patients with renal impairment. Contraindicated with severe renal impairment (Cl_{cr} <30 mL/minute).

Dosing: Hepatic ImpairmentUse with caution with moderate hepatic impairment. Contraindicated with severe hepatic impairment and/or cholestasis.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be given with or without food.

StorageStore at 25°C (77°F). Store in tightly closed container.

ContraindicationsHypersensitivity to candesartan, hydrochlorothiazide, or any component of the formulation; hypersensitivity to sulfonamide-derived drugs; severe renal impairment (Cl_{cr} <30 mL/minute); severe hepatic impairment and/or cholestasis; refractory hypokalemia; refractory hypercalcemia; gout; pregnancy; breast-feeding

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with angiotensin II receptor antagonists; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with moderate hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy. Contraindicated with severe hepatic impairment and/or cholestasis.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use candesartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use candesartan with caution with pre-existing renal insufficiency. May precipitate azotemia; discontinue or consider withholding if renal impairment occurs. Contraindicated in severe renal disease (Cl_{cr} <30 mL/minute).

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Concurrent drug therapy issues:

- ACE inhibitors: Although some properties may be shared between these agents, concurrent therapy with ACE inhibitor may be rational in selected patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Anesthesia/surgery: Hypotension may occur during major surgery and anesthesia; use cautiously before, during, and immediately after such interventions.

Geriatric ConsiderationsNo initial dosage adjustment is recommended in patients with normal renal and hepatic function; some patients may have increased sensitivity.

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)

Pregnancy Considerations

Candesartan: C/D (2nd and 3rd trimesters): Discontinue as soon as possible when pregnancy is detected. Drugs that act directly on renin-angiotensin can cause fetal and neonatal morbidity and death. Adverse effects to the fetus appear to be limited to the 2nd and 3rd trimesters.

Hydrochlorothiazide: B (per manufacturer), D (based on expert analysis): Although there are no adequate and well-controlled studies using hydrochlorothiazide in pregnancy, thiazide diuretics may cause an increased risk of congenital defects. Hypoglycemia, hypokalemia, hyponatremia, jaundice, and thrombocytopenia are also reported as possible complications to the fetus or newborn.

LactationEnters breast milk/contraindicated

Breast-Feeding Considerations

Candesartan: Avoid use in the nursing mother, if possible, since candesartan may be excreted in breast milk.

Hydrochlorothiazide: Thiazides are excreted in human breast milk. Benefits to the mother should be weighed against possible risk to the newborn if used in a nursing woman.

Adverse ReactionsReactions which follow have been reported with the combination product; see individual drug agents for additional adverse reactions that may be expected from each agent.

1% to 10%:

Central nervous system: Dizziness (3%), headache (3%, placebo 5%)

Neuromuscular & skeletal: Back pain (3%)

Respiratory: Upper respiratory tract infection (4%)

Miscellaneous: Flu-like syndrome (2%)

<1%: Abdominal pain, abnormal ECG, abnormal hepatic function, agranulocytosis, angina pectoris, angioedema (<0.5%), anxiety, arthralgia, arthritis, arthrosis, asthenia, bradycardia, bronchitis, BUN increased, chest pain, conjunctivitis, cough, CPK increased, cystitis, depression, dermatitis, diaphoresis increased, diarrhea, dyspepsia, dyspnea, eczema, epistaxis, extrasystoles, fatigue, gastritis, gastroenteritis, hematuria, hepatitis, hyperglycemia, hyperuricemia, hypoesthesia, hypokalemia, infection, insomnia, leg cramps, leukopenia, myalgia, MI (<0.5%), nausea, neutropenia, pain, palpitation, paresthesia, peripheral edema, pharyngitis, pruritus, rash, rhinitis, sciatica, sinusitis, tachycardia, tinnitus, transaminases increased, urinary tract infection, urticaria, vertigo, viral infection, vomiting; rhabdomyolysis has been reported (rarely) with angiotensin-receptor antagonists

Metabolism/Transport EffectsCandesartan: **Substrate** of CYP2C9 (minor); **Inhibits** CYP2C8 (weak), 2C9 (weak)

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may potentiate orthostatic hypotension).

Monitoring ParametersAssess weight, I & O reports daily to determine fluid loss; blood pressure, symptomatic hypotension, and tachycardia; serum electrolytes, BUN, creatinine

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSerum electrolytes, BUN, creatinine

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Atacand HCT®:

16/12.5: Candesartan cilexetil 16 mg and hydrochlorothiazide 12.5 mg

32/12.5: Candesartan cilexetil 32 mg and hydrochlorothiazide 12.5 mg

32/25: Candesartan cilexetil 32 mg and hydrochlorothiazide 25 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Atacand HCT)

16-12.5 mg (30): $83.19

32-12.5 mg (30): $85.27

Mechanism of Action

Candesartan: Candesartan is an angiotensin receptor antagonist. Angiotensin II acts as a vasoconstrictor. In addition to causing direct vasoconstriction, angiotensin II also stimulates the release of aldosterone. Once aldosterone is released, sodium as well as water are reabsorbed. The end result is an elevation in blood pressure. Candesartan binds to the AT1 angiotensin II receptor. This binding prevents angiotensin II from binding to the receptor, thereby blocking the vasoconstriction and the aldosterone-secreting effects of angiotensin II.

Hydrochlorothiazide: Inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause decreased renal lithium clearance; monitor serum lithium levels

Cardiovascular Considerations

Congestive Heart Failure: Currently, the use of angiotensin II receptor blockers (ARBs) should not supersede angiotensin converting enzyme inhibitors (ACEIs) in the treatment of congestive heart failure. One may be considered, however, when an ACEI cannot be tolerated. Because they are angiotensin II blockers rather than inhibitors of ACE, ARBs do not cause increases in bradykinin levels. *ELITE II* (Pitt, 2000) compared losartan (50 mg/day) with captopril (150 mg/day) in a heart failure population (mean EF 31%). There were 280 deaths in the losartan group and 250 in the captopril group. Mortality was insignificantly higher for losartan (17.7% vs 16% for captopril). The secondary endpoint (sudden cardiac death or resuscitated cardiac arrest) favored captopril, but the improvement did not achieve statistical significance. The discontinuation rate for adverse events was significantly lower for losartan. In the doses used, losartan appears to be less effective or as effective as captopril.

CHARM-Alternative is a prospective, randomized trial (Granger, 2003) in ACE inhibitor-intolerant patients with CHF. Patients were randomized to candesartan (target dose: 32 mg/day; mean dose at 6 months: 23 mg/day) or placebo. Baseline characteristics included NYHA Class II or III (97% of patients), and mean LVEF 30%. Therapy included beta-blocker (55%), diuretic (86%), spironolactone (24%), and digitalis (46%). During a 33-month follow-up, the combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group mainly because of reduced hospitalization. Death due to cardiovascular disease was not significantly different. There were significantly more MIs (75) in the candesartan group than in the placebo group (48). Candesartan was discontinued because of hypotension, renal dysfunction, and hyperkalemia.

Congestive Heart Failure: Concomitant ACE-I Therapy: The *Val-HeFT study* (Cohn, 2001) randomized CHF patients maintained on standard therapy to valsartan (320 mg/day; mean dose 254 mg/day) or placebo. The primary outcome was mortality and a combined endpoint of morbidity and mortality (cardiac arrest, hospitalization for CHF, need for intravenous inotrope or vasodilator). Patients (5010 in number) with predominately NYHA class II or III heart failure (85% on diuretic, 67% on digoxin, 35% on beta-blocker, ~93% on ACEI, 5% on spironolactone) were randomized to valsartan or placebo. The mean duration of follow-up was 23 months. Overall mortality was similar in both groups. The incidence of combined endpoints was lower with valsartan than placebo (p=.009) primarily because of decreased heart failure hospitalizations in the valsartan group. In a posthoc analysis of the endpoints in subgroups defined by baseline treatments (ACEI or beta-blockers), valsartan had a positive effect on patients receiving neither or one of these drugs. A higher incidence of mortality was seen in patients receiving valsartan in combination with an ACEI and a beta-blocker.

CHARM-Added trial is a prospective, randomized trial (McMurray, 2003) evaluating the addition of candesartan therapy (target dose: 32 mg/day; mean dose at 6 months: 24 mg/day) to CHF patients maintained on an ACEI. Baseline characteristics: NYHA class II (24%), class III (73%), and mean LVEF 28%. Baseline therapy was similar to CHARM-Alternative except all patients were maintained on an ACEI and ~55% were on a beta-blocker. The median duration of follow-up was 41 months. The combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group.

Hypertension: According to the 2003 JNC7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Myocardial Infarction: The 2004 ACC/AHA STEMI guidelines suggest an angiotensin receptor blocker should be administered to STEMI patients who are intolerant of ACE inhibitors and who have either clinical or radiological signs of heart failure or LVEF <0.4. The *OPTIMAAL trial* evaluated whether losartan (50 mg/day) would be superior or noninferior to captopril (150 mg/day) in post-MI patients. They were randomized to one of two treatments and followed up for 2.7 years. There was no difference between the two treatment groups (499 deaths in losartan group; 447 deaths in the captopril-treated group). The VALIANT trial compared the effects of valsartan, captopril, and the combination in patients who had suffered a recent MI (0.5 to 10 days prior) complicated by left ventricular systolic dysfunction (Pfeffer, 2003). The primary endpoint was mortality from any cause. Mortality in the valsartan group and the valsartan-captopril group was similar to the captopril group alone. Valsartan was found to be noninferior to captopril in this patient population. Combining valsartan with captopril increased the rate of adverse events without improving survival. Hypotension and renal dysfunction were more common in the valsartan group. Cough, rash, and taste disturbances were more common in the captopril group.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(kan de SAR tan)

U.S. Brand NamesAtacand®

Canadian Brand NamesAtacand®

Pharmacologic CategoryAngiotensin II Receptor Blocker

Use: Labeled IndicationsAlone or in combination with other antihypertensive agents in treating essential hypertension; treatment of heart failure (NYHA class II-IV)

Dosing: Adults

Hypertension: Oral: 4-32 mg once daily. Dosage must be individualized. Blood pressure response is dose related over the range of 2-32 mg. The usual recommended starting dose is 16 mg once daily when it is used as monotherapy in patients who are not volume depleted. It can be administered once or twice daily with total daily doses ranging from 8-32 mg; larger doses do not appear to have a greater effect and there is relatively little experience with such doses.

Congestive heart failure: Oral: Initial: 4 mg once daily; double the dose at 2-week intervals, as tolerated; target dose: 32 mg

Note: In selected cases, concurrent therapy with an ACE inhibitor may provide additional benefit.

Dosing: ElderlyRefer to adult dosing. No initial dosage adjustment is necessary for elderly patients (although higher concentrations (C_{max}) and AUC were observed in these populations), for patients with mildly impaired renal function, or for patients with mildly impaired hepatic function.

Dosing: Hepatic Impairment

Mild hepatic impairment: No initial dosage adjustment required.

Moderate hepatic impairment: Consider initiation at lower dosages (AUC increased by 145%).

Severe hepatic impairment and/or cholestasis: Contraindicated

ContraindicationsHypersensitivity to candesartan or any component of the formulation; severe hepatic impairment and/or cholestasis; pregnancy; breast-feeding

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Hyperkalemia: May occur; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use caution in patients with significant aortic/mitral stenosis.

- Heart failure: Use caution when initiating in heart failure; may need to adjust dose, and/or concurrent diuretic therapy, because of candesartan-induced hypotension.

- Hepatic impairment: Use caution in patients with moderate hepatic impairment. Contraindicated in severe hepatic impairment and/or cholestasis.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use candesartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution with pre-existing renal insufficiency and severe renal impairment.

Concurrent drug therapy issues:

- ACE inhibitors: Although some properties may be shared between these agents, concurrent therapy with ACE inhibitor may be rational in selected patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Anesthesia/surgery: Hypotension may occur during major surgery and anesthesia; use cautiously before, during, and immediately after such interventions.

Geriatric Considerations High concentrations occur in the elderly compared to younger subjects. AUC may be doubled in patients with renal impairment. No initial dose adjustment necessary since repeated dose did not demonstrate accumulation of drug or metabolites in elderly.

Pregnancy Risk Factor C (1st trimester); D (2nd and 3rd trimesters)

Pregnancy Considerations Medications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. There are no adequate and well-controlled studies in pregnant women. **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Lactation Enters breast milk/contraindicated

Adverse Reactions

Cardiovascular: Angina, hypotension (CHF 19%), MI, palpitation, tachycardia

Central nervous system: Dizziness, lightheadedness, drowsiness, headache, vertigo, anxiety, depression, somnolence, fever

Dermatologic: Angioedema, rash

Endocrine & metabolic: Hyperglycemia, hyperkalemia (CHF <1% to 6%), hypertriglyceridemia, hyperuricemia

Gastrointestinal: Dyspepsia, gastroenteritis

Genitourinary: Hematuria

Neuromuscular & skeletal: Back pain, CPK increased, myalgia, paresthesia, weakness

Renal: Serum creatinine increased (up to 13% in patients with CHF with drug discontinuation required in 6%)

Respiratory: Dyspnea, epistaxis, pharyngitis, rhinitis, upper respiratory tract infection

Miscellaneous: Diaphoresis increased

<1%, postmarketing, and/or case reports: Abnormal hepatic function, agranulocytosis, anemia, hepatitis, hyponatremia, leukopenia, neutropenia, pruritus, renal failure, renal impairment, rhinitis, sinusitis, thrombocytopenia, urticaria; rhabdomyolysis has been reported (rarely) with angiotensin-receptor antagonists

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor); **Inhibits** CYP2C8 (weak), 2C9 (weak)

Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Food reduces the time to maximal concentration and increases the C_{max}.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersSupine blood pressure, electrolytes, serum creatinine, BUN, urinalysis, symptomatic hypotension, and tachycardia; in CHF, serum potassium during dose escalation and periodically thereafter

Nursing: Physical Assessment/MonitoringEvaluate renal status and history prior to beginning treatment. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, increased risk for hypotension, hyperkalemia). Assess results of laboratory tests (electrolytes, serum creatinine, BUN, urinalysis), effectiveness of therapy (reduced hypertension), and adverse response (eg, tachycardia, CNS changes, hyperglycemia, hypotension) at beginning of therapy, when changing dose, and on a regular basis during long-term therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsElectrolytes, serum creatinine, BUN, urinalysis; in CHF, serum potassium during dose escalation and periodically thereafter

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed and do not discontinue medication without consulting prescriber. Preferable to take on an empty stomach, 1 hour before or 2 hours after meals. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (boiled milk, buttermilk, or yogurt may help). Report chest pain or palpitations; unusual weight gain or swelling of ankles and hands; persistent fatigue; unusual flu or cold symptoms or dry cough; respiratory difficulty; swelling of eyes, face, or lips; skin rash; muscle pain or weakness; unusual bleeding (blood in urine or stool, or from gums); or excessive sweating. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as cilexetil:

Atacand®: 4 mg, 8 mg, 16 mg, 32 mg

16 mg (30): $61.99

32 mg (30): $84.23

Mechanism of ActionCandesartan is an angiotensin receptor antagonist. Angiotensin II acts as a vasoconstrictor. In addition to causing direct vasoconstriction, angiotensin II also stimulates the release of aldosterone. Once aldosterone is released, sodium as well as water are reabsorbed. The end result is an elevation in blood pressure. Candesartan binds to the AT1 angiotensin II receptor. This binding prevents angiotensin II from binding to the receptor thereby blocking the vasoconstriction and the aldosterone secreting effects of angiotensin II.

Pharmacodynamics/Kinetics

Onset of action: 2-3 hours

Peak effect: 6-8 hours

Duration: >24 hours

Distribution: V_d: 0.13 L/kg

Protein binding: 99%

Metabolism: To candesartan by the intestinal wall cells

Bioavailability: 15%

Half-life elimination (dose dependent): 5-9 hours

Time to peak: 3-4 hours

Excretion: Urine (26%)

Clearance: Total body: 0.37 mL/kg/minute; Renal: 0.19 mL/kg/minute

Related Information

- Angiotensin Agents

Pharmacotherapy PearlsMay have an advantage over losartan due to minimal metabolism requirements and consequent use in mild-to-moderate hepatic impairment
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness; may rarely cause anxiety or depression
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular Considerations

Congestive Heart Failure: Currently, the use of angiotensin II receptor blockers (ARBs) should not supersede angiotensin converting enzyme inhibitors (ACEIs) in the treatment of congestive heart failure. One may be considered, however, when an ACEI cannot be tolerated. Because they are angiotensin II blockers rather than inhibitors of ACE, ARBs do not cause increases in bradykinin levels. *ELITE II* (Pitt, 2000) compared losartan (50 mg/day) with captopril (150 mg/day) in a heart failure population (mean EF 31%). There were 280 deaths in the losartan group and 250 in the captopril group. Mortality was insignificantly higher for losartan (17.7% vs 16% for captopril). The secondary endpoint (sudden cardiac death or resuscitated cardiac arrest) favored captopril, but the improvement did not achieve statistical significance. The discontinuation rate for adverse events was significantly lower for losartan. In the doses used, losartan appears to be less effective or as effective as captopril.

CHARM-Alternative is a prospective, randomized trial (Granger, 2003) in ACE inhibitor-intolerant patients with CHF. Patients were randomized to candesartan (target dose: 32 mg/day; mean dose at 6 months: 23 mg/day) or placebo. Baseline characteristics included NYHA Class II or III (97% of patients), and mean LVEF 30%. Therapy included beta-blocker (55%), diuretic (86%), spironolactone (24%), and digitalis (46%). During a 33-month follow-up, the combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group mainly because of reduced hospitalization. Death due to cardiovascular disease was not significantly different. There were significantly more MIs (75) in the candesartan group than in the placebo group (48). Candesartan was discontinued because of hypotension, renal dysfunction, and hyperkalemia.

Congestive Heart Failure: Concomitant ACE-I Therapy: The *Val-HeFT study* (Cohn, 2001) randomized CHF patients maintained on standard therapy to valsartan (320 mg/day; mean dose 254 mg/day) or placebo. The primary outcome was mortality and a combined endpoint of morbidity and mortality (cardiac arrest, hospitalization for CHF, need for intravenous inotrope or vasodilator). Patients (5010 in number) with predominately NYHA class II or III heart failure (85% on diuretic; 67% on digoxin; 35% on beta-blocker; ~93% on ACEI; 5% on spironolactone) were randomized to valsartan or placebo. The mean duration of follow-up was 23 months. Overall mortality was similar in both groups. The incidence of combined endpoints was lower with valsartan than placebo (p=.009) primarily because of decreased heart failure hospitalizations in the valsartan group. In a posthoc analysis of the endpoints in subgroups defined by baseline treatments (ACEI or beta-blockers), valsartan had a positive effect on patients receiving neither or one of these drugs. A higher incidence of mortality was seen in patients receiving valsartan in combination with an ACEI and a beta-blocker.

CHARM-Added trial is a prospective, randomized trial (McMurray, 2003) evaluating the addition of candesartan therapy (target dose: 32 mg/day; mean dose at 6 months: 24 mg/day) to CHF patients maintained on an ACEI. Baseline characteristics: NYHA class II (24%), class III (73%), and mean LVEF 28%. Baseline therapy was similar to CHARM-Alternative except all patients were maintained on an ACEI and ~55% were on a beta-blocker. The median duration of follow-up was 41 months. The combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group.

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Myocardial Infarction: The 2004 ACC/AHA STEMI guidelines suggest an angiotensin receptor blocker should be administered to STEMI patients who are intolerant of ACE inhibitors and who have either clinical or radiological signs of heart failure or LVEF <0.4. The *OPTIMAAL trial* evaluated whether losartan (50 mg/day) would be superior or noninferior to captopril (150 mg/day) in post-MI patients. They were randomized to one of two treatments and followed up for 2.7 years. There was no difference between the two treatment groups (499 deaths in losartan group; 447 deaths in the captopril-treated group). The VALIANT trial compared the effects of valsartan, captopril, and the combination in patients who had suffered a recent MI (0.5 to 10 days prior) complicated by left ventricular systolic dysfunction (Pfeffer, 2003). The primary endpoint was mortality from any cause. Mortality in the valsartan group and the valsartan-captopril group was similar to the captopril group alone. Valsartan was found to be noninferior to captopril in this patient population. Combining valsartan with captopril increased the rate of adverse events without improving survival. Hypotension and renal dysfunction were more common in the valsartan group. Cough, rash, and taste disturbances were more common in the captopril group.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Anesthesia and Critical Care Concerns/Other Considerations The angiotensin II receptor antagonists appear to have similar indications as the ACE inhibitors. In heart failure, the angiotensin II antagonists are especially useful in providing an alternative therapy in those patients who have intractable cough in response to ACE inhibitor therapy. Candesartan has been studied as an alternative therapy in chronic heart failure patients who cannot tolerate an ACE-I (CHARM-Alternative) and as an added therapy in heart failure patients who are maintained on an ACE-I (CHARM-Added). In both studies, the combined endpoint of cardiovascular death or heart failure hospitalizations was significantly improved over the placebo-treated group. Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control.

Pharmacologic Category[Chemotherapy Regimen, Breast Cancer]

Regimen UseBreast cancer

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Capecitabine: Oral: 1250 mg/m^2 twice daily days 1 to 14

[total dose/cycle = 35,000 mg/m^2]

Docetaxel: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 3 weeks

Variation 2:

Capecitabine: Oral: 1000 mg/m^2 twice daily days 2 to 15

[total dose/cycle = 28,000 mg/m^2]

Docetaxel: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 3 weeks

Variation 3:

Capecitabine: Oral: 937.5 mg/m^2 twice daily days 2 to 15

[total dose/cycle = 26,250 mg/m^2]

Docetaxel: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 3 weeks

Capecitabine-Trastuzumab

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category[Chemotherapy Regimen, Breast Cancer](#)

Regimen UseBreast cancer

Index TermsTrastuzumab-Capecitabine

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Cycle 1:

Capecitabine: Oral: 1250 mg/m^2 twice daily days 1 to 14

[total dose/cycle 1 = 35,000 mg/m^2]

Trastuzumab: I.V.: 4 mg/kg (loading dose) day 1 cycle 1

followed by I.V.: 2 mg/kg/day days 8 and 15 cycle 1

[total dose/cycle 1 = 8 mg/kg]

Treatment cycle is 21 days

Subsequent cycles:

Capecitabine: Oral: 1250 mg/m^2 twice daily days 1 to 14

[total dose/cycle = 35,000 mg/m^2]

Trastuzumab: I.V.: 2 mg/kg/day days 1, 8, and 15

[total dose/cycle = 6 mg/kg]

Repeat cycle every 21 days

Variation 2:

Cycle 1:

Capecitabine: Oral: 1250 mg/m^2 twice daily days 1 to 14

[total dose/cycle 1 = 35,000 mg/m^2]

Trastuzumab: I.V.: 8 mg/kg (loading dose) day 1 cycle 1

[total dose/cycle 1 = 8 mg/kg]

Treatment cycle is 21 days

Subsequent cycles:

Capecitabine: Oral: 1250 mg/m^2 twice daily days 1 to 14

[total dose/cycle = 35,000 mg/m^2]

Trastuzumab: I.V.: 6 mg/kg day 1

[total dose/cycle = 6 mg/kg]

Repeat cycle every 21 days

Capecitabine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Xeloda® may be confused with Xenical®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ka pe SITE a been)

U.S. Brand NamesXeloda®

Canadian Brand NamesXeloda®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite; Antineoplastic Agent, Antimetabolite (Pyrimidine Analog)

Use: Labeled IndicationsTreatment of metastatic colorectal cancer; adjuvant therapy of Dukes' C colon cancer; treatment of metastatic breast cancer

Use: Unlabeled/InvestigationalTreatment of gastric cancer, pancreatic cancer, esophageal cancer, ovarian cancer, metastatic renal cell cancer, neuroendocrine tumors, metastatic CNS lesions

Dosing: Adults**Note:** Details concerning dosing in combination regimens should also be consulted. Capecitabine toxicities, particularly hand-foot syndrome, may be higher in North American populations (for the treatment of colorectal cancer); therapy initiation at doses of 1000 mg/m^2 twice daily (for 2 weeks every 21 days) may be considered (Haller, 2006; NCCN Colon Cancer Guidelines)

Metastatic breast cancer, metastatic colorectal cancer: Oral: 1250 mg/m^2 twice daily (morning and evening) for 2 weeks, every 21 days

Adjuvant therapy of Dukes' C colon cancer: Recommended for a total of 24 weeks (8 cycles of 2 weeks of drug administration and 1 week rest period.

Pancreatic cancer (unlabeled use): 1000-1250 mg/m^2 twice daily (morning and evening) for 2 weeks, every 21 days

Dosing: ElderlyThe elderly may be more sensitive to the toxic effects of fluorouracil. Insufficient data are available to provide dosage modifications.

Dosing: Renal Impairment

Cl$_{cr}$ 51-80 mL/minute: No adjustment of initial dose.

Cl$_{cr}$ 30-50 mL/minute: Administer 75% of normal dose.

Cl$_{cr}$ <30 mL/minute: Use is contraindicated.

Dosing: Hepatic Impairment

Mild-to-moderate impairment: No starting dose adjustment is necessary; however, carefully monitor patients.

Severe hepatic impairment: Patients have not been studied.

Dosing: Adjustment for Toxicity

Dosage modification guidelines: See table.

Refer to package labeling for modifications when administered in combination with docetaxel.

Recommended Dose Modifications

Toxicity NCI Grades	During a Course of Therapy (Monotherapy)	Dose Adjustment for Next Cycle (% of starting dose)
Grade 1	Maintain dose level	Maintain dose level
Grade 2		
1st appearance	Interrupt until resolved to grade 0-1	100%

2nd appearance	Interrupt until resolved to grade 0-1	75%
3rd appearance	Interrupt until resolved to grade 0-1	50%
4th appearance	Discontinue treatment permanently	
Grade 3		
1st appearance	Interrupt until resolved to grade 0-1	75%
2nd appearance	Interrupt until resolved to grade 0-1	50%
3rd appearance	Discontinue treatment permanently	
Grade 4		
1st appearance	Discontinue permanently	
	or	
	If physician deems it to be in the patient's best interest to continue, interrupt until resolved to grade 0-1	50%

Dosage adjustments for hematologic toxicity in combination therapy with ixabepilone:

Neutrophils $<500/\text{mm}^3$ for ≥7 days or neutropenic fever: Hold for concurrent diarrhea or stomatitis until neutrophils recover to $>1000/\text{mm}^3$, then continue at same dose

Platelets $<25{,}000/\text{mm}^3$ (or $<50{,}000/\text{mm}^3$ with bleeding): Hold for concurrent diarrhea or stomatitis until platelets recover to $>50{,}000/\text{mm}^3$, then continue at same dose

Dosing: Combination Regimens

Biliary adenocarcinoma: Gemcitabine-Capecitabine

Breast cancer:

- Bevacizumab-Capecitabine
- Capecitabine + Docetaxcel (Breast Cancer)
- Capecitabine + Lapatinib
- Capecitabine-Trastuzumab
- Ixabepilone-Capecitabine
- TEX (Capecitabine + Docetaxel + Epirubicin)

Colorectal cancer: XelOx

Esophageal cancer: Epirubicin-Oxaliplatin-Capecitabine

Gastric cancer:

- Capecitabine + Docetaxel (Gastric Cancer)
- Epirubicin-Oxaliplatin-Capecitabine

Lung cancer (nonsmall cell): Capecitabine + Docetaxel (NSCLC)

Pancreatic cancer: Gemcitabine-Capecitabine

Calculations

- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: OralUsually administered in 2 divided doses taken 12 hours apart. Doses should be taken with water within 30 minutes after a meal.

Dietary ConsiderationsBecause current safety and efficacy data are based upon administration with food, it is recommended that capecitabine be administered with food. In all clinical trials, patients were instructed to take with water within 30 minutes after a meal.

StorageStore at room temperature of 25°C (77°F); excursions between 15°C and 30°C (59°F and 86°F) permitted.

Extemporaneously PreparedCapecitabine oral solution: A solution of capecitabine in water may be prepared by adding 2000 mg capecitabine (powder) to 200 mL water. Capecitabine tablets are water soluble (data on file from Roche). Administer immediately after preparation, 30 minutes after a meal. Use appropriate precautions for handling and disposal.

> Judson IR, Beale PJ, Trigo JM, et al, "A Human Capecitabine Excretion Balance and Pharmacokinetic Study After Administration of a Single Oral Dose of ^{14}C-Labelled Drug," *Invest New Drugs*, 1999, 17(1):49-56.

ContraindicationsHypersensitivity to capecitabine, fluorouracil, or any component of the formulation; known deficiency of dihydropyrimidine dehydrogenase (DPD); severe renal impairment (Cl_{cr} <30 mL/minute)

Warnings/Precautions

Boxed warnings:

- Warfarin: See "Concurrent drug therapy issues" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Cardiotoxicity: There has been cardiotoxicity associated with fluorinated pyrimidine therapy, including myocardial infarction, angina, dysrhythmias, cardiogenic shock, sudden death, ECG changes, and cardiomyopathy. These adverse events may be more common in patients with a history of coronary artery disease.
- Diarrhea: Can cause severe diarrhea; median time to first occurrence is 34 days; subsequent doses should be reduced after grade 3 or 4 diarrhea or recurrence of grade 2 diarrhea.
- Hand-and-foot syndrome: May cause hand-and-foot syndrome (palmar-plantar erythrodysesthesia or chemotherapy-induced acral erythema) is characterized by numbness, dysesthesia/paresthesia, tingling, painless or painful swelling, erythema, desquamation, blistering, and severe pain. If grade 2 or 3 hand-and-foot syndrome occurs, interrupt administration of capecitabine until the event resolves or decreases in intensity to grade 1. Following grade 3 hand-and-foot syndrome, decrease subsequent doses of therapy.
- Necrotizing enterocolitis (typhlitis): Has been reported.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression.
- Dihydropyrimidine dehydrogenase (DPD) deficiency: Rare and unexpected severe toxicity (stomatitis, diarrhea, neutropenia, neurotoxicity) may be attributed to dihydropyrimidine dehydrogenase (DPD) deficiency.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; reduce dose with moderate impairment and carefully monitor and reduce subsequent dose (with any grade 2 or higher adverse effect) with mild-to-moderate impairment.

Concurrent drug therapy issues:

- Alkylating therapy: Use with caution in patients who have received alkylating therapy.
- Fluorouracil/leucovorin (FU/LV): In patients with colorectal cancer, treatment with capecitabine immediately following 6 weeks of FU/LV therapy has been associated with an increased incidence of grade ≥3 toxicity, when compared to patients receiving the reverse sequence, capecitabine (two 3-week courses) followed by FU/LV (Hennig, 2008).
- Warfarin: **[U.S. Boxed Warning]: Capecitabine may increase the anticoagulant effects of warfarin; monitor closely.**

Special populations:

- Elderly: Use with caution in patients ≥80 years of age.
- Pediatrics: Safety and efficacy have not been established in children.
- Pelvic radiation therapy recipients: Use with caution in patients who have received extensive pelvic radiation.

Geriatric ConsiderationsPatients ≥80 years of age may experience a greater incidence of grade 3 or 4 adverse events (diarrhea, hand-and-foot syndrome, nausea/vomiting).

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and fetal loss. There are no adequate and well-controlled studies in pregnant women; however, fetal harm may occur. Women of childbearing potential should avoid pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if the drug is excreted in breast milk. Because of the potential for serious adverse reactions in nursing infants, it is recommended that nursing be discontinued when receiving capecitabine therapy.

Adverse ReactionsFrequency listed derived from monotherapy trials.

>10%:

Cardiovascular: Edema (9% to 15%)

Central nervous system: Fatigue (16% to 42%), fever (7% to 18%), pain (12%)

Dermatologic: Palmar-plantar erythrodysesthesia (hand-and-foot syndrome) (54% to 60%; grade 3: 11% to 17%; may be dose limiting), dermatitis (27% to 37%)

Gastrointestinal: Diarrhea (47% to 57%; may be dose limiting; grade 3: 12% to 13%; grade 4: 2% to 3%), nausea (34% to 53%), vomiting (15% to 37%), abdominal pain (7% to 35%), stomatitis (22% to 25%), appetite decreased (26%), anorexia (9% to 23%), constipation (9% to 15%)

Hematologic: Lymphopenia (94%; grade 4: 14%), anemia (72% to 80%; grade 4: <1% to 1%), neutropenia (2% to 26%; grade 4: 2%), thrombocytopenia (24%; grade 4: 1%)

Hepatic: Bilirubin increased (22% to 48%; grades 3/4: 11% to 23%)

Neuromuscular & skeletal: Paresthesia (21%)

Ocular: Eye irritation (13% to 15%)

Respiratory: Dyspnea (14%)

5% to 10%:

Cardiovascular: Venous thrombosis (8%), chest pain (6%)

Central nervous system: Headache (5% to 10%), lethargy (10%), dizziness (6% to 8%), insomnia (7% to 8%), mood alteration (5%), depression (5%)

Dermatologic: Nail disorder (7%), rash (7%), skin discoloration (7%), alopecia (6%), erythema (6%)

Endocrine & metabolic: Dehydration (7%)

Gastrointestinal: Motility disorder (10%), oral discomfort (10%), dyspepsia (6% to 8%), upper GI inflammatory disorders (colorectal cancer: 8%), hemorrhage (6%), ileus (6%), taste perversion (colorectal cancer: 6%)

Neuromuscular & skeletal: Back pain (10%), weakness (10%), neuropathy (10%), myalgia (9%), arthralgia (8%), limb pain (6%)

Ocular: Abnormal vision (colorectal cancer: 5%), conjunctivitis (5%)

Respiratory: Cough (7%)

Miscellaneous: Viral infection (colorectal cancer: 5%)

<5%: Abdominal distension, angina, appetite increased, arthritis, ascites, asthma, ataxia, atrial fibrillation, bone pain, bradycardia, bronchitis, bronchopneumonia, bronchospasm, cachexia, cardiac arrest, cardiac failure, cardiomyopathy, cerebral vascular accident, cholestasis, coagulation disorder, colitis, confusion, deep vein thrombosis, diaphoresis, duodenitis, dysarthria, dysphagia, dysrhythmia, ecchymoses, ECG changes, encephalopathy, epistaxis, esophagitis, fibrosis, fungal infection, gastric ulcer, gastritis, gastroenteritis, hematemesis, hemoptysis, hepatic fibrosis, hepatitis, hoarseness, hot flushes, hypokalemia, hypomagnesemia, hyper-/hypotension, hypersensitivity, hypertriglyceridemia, idiopathic thrombocytopenia purpura, ileus, impaired balance, infection, influenza-like illness, intestinal obstruction (~1%), irritability, joint stiffness, keratoconjunctivitis, laryngitis, leukopenia, loss of consciousness, lymphedema, MI, myocardial ischemia, myocarditis, necrotizing enterocolitis (typhlitis), nocturia, oral candidiasis, pericardial effusion, thrombocytopenic purpura, pancytopenia, photosensitivity reaction, pneumonia, proctalgia, pruritus, pulmonary embolism, radiation recall syndrome, renal impairment, respiratory distress, sedation, sepsis, skin ulceration, sore throat, tachycardia, thirst, thrombophlebitis, toxic megacolon, tremor, ventricular extrasystoles, vertigo, weight gain

Postmarketing and/or case reports: Hepatic failure, lacrimal duct stenosis, multifocal leukoencephalopathy

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Phenytoin: Capecitabine may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Capecitabine may increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food reduced the rate and extent of absorption of capecitabine.

Monitoring ParametersRenal function should be estimated at baseline to determine initial dose. During therapy, CBC with differential, hepatic function, and renal function should be monitored.

Nursing: Physical Assessment/MonitoringMonitor coagulation parameters regularly for patients receiving an oral coumarin-derivative anticoagulant. Assess results of laboratory tests (renal and hepatic function, CBC with differential) at baseline and during therapy. Monitor therapeutic response and adverse reactions (eg, gastrointestinal disturbance [nausea, vomiting, pain, dehydration, or severe diarrhea that can occur at any time during therapy], hematologic [lymphopenia, anemia, thrombocytopenia], cardiovascular [edema, chest pain], and paresthesia) periodically during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsRenal function should be estimated at baseline to determine initial dose. During therapy, CBC with differential, hepatic function, and renal function should be monitored.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take with water within 30 minutes after meal. Avoid use of antacids within 2 hours of taking this medication. Do not crush, chew, or dissolve tablets. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause lethargy, dizziness, visual changes, confusion, anxiety (avoid driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); loss of hair (will grow back when treatment is discontinued); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); or dry, itchy, skin, and dry or irritated eyes (avoid contact lenses). Report persistent diarrhea or abdominal pain; skin rash, pain, tenderness, or peeling (especially hands and feet); chills or fever, confusion, persistent or violent vomiting; respiratory difficulty; chest pain or palpitations; unusual bleeding or bruising; bone pain; muscle spasms/tremors; or vision changes immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Xeloda®: 150 mg, 500 mg

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Xeloda)

150 mg (60): $371.93

500 mg (120): $2408.11

Mechanism of ActionCapecitabine is a prodrug of fluorouracil. It undergoes hydrolysis in the liver and tissues to form fluorouracil which is the active moiety. Fluorouracil is a fluorinated pyrimidine antimetabolite that inhibits thymidylate synthetase, blocking the methylation of deoxyuridylic acid to thymidylic acid, interfering with DNA, and to a lesser degree, RNA synthesis. Fluorouracil appears to be phase specific for the G_1 and S phases of the cell cycle.

Pharmacodynamics/Kinetics

Absorption: Rapid and extensive

Protein binding: <60%; ~35% to albumin

Metabolism:

Hepatic: Inactive metabolites: 5′-deoxy-5-fluorocytidine, 5′-deoxy-5-fluorouridine

Tissue: Active metabolite: Fluorouracil

Half-life elimination: 0.5-1 hour

Time to peak: 1.5 hours; Fluorouracil: 2 hours

Excretion: Urine (96%, 57% as α-fluoro-β-alanine); feces (<3%)

Medication Safety Issues

Sound-alike/look-alike issues:

Capastat® may be confused with Cepastat®

Pronunciation(kap ree oh MYE sin)

U.S. Brand NamesCapastat® Sulfate

Pharmacologic CategoryAntibiotic, Miscellaneous; Antitubercular Agent

Use: Labeled IndicationsTreatment of tuberculosis in conjunction with at least one other antituberculosis agent

Dosing: AdultsTuberculosis: I.M., I.V.: 1 g/day (maximum: 20 mg/kg/day) for 60-120 days, followed by 1 g 2-3 times/week **or** 15 mg/kg/day (maximum: 1 g/dose) for 2-4 months, followed by 15 mg/kg (maximum: 1 g/dose) 2-3 times/week (*MMWR*, 2003)

Dosing: ElderlyRefer to adult dosing. Use with caution due to the increased potential for pre-existing renal dysfunction or impaired hearing. The manufacturer recommends initiating at lower end of dosing range. Adults >59 years of age: 10 mg/kg (maximum: 750 mg/dose) for 5-7 days per week for 2-4 months, followed by 10 mg/kg (maximum: 750 mg/dose) 2-3 times/week (*MMWR*, 2003).

Dosing: PediatricTuberculosis: I.M., I.V.:

Infants and Children <15 years and ≤40 kg (unlabeled use): 15-30 mg/kg/day (maximum: 1 g/day) for 2-4 months, followed by 15-30 mg/kg (maximum: 1 g/day) twice weekly (*MMWR*, 2003)

Children ≥15 years or >40 kg (unlabeled use): 15 mg/kg/day (maximum: 1 g/dose) for 2-4 months followed by 15 mg/kg (maximum: 1 g/dose) 2-3 times/week (*MMWR*, 2003)

Dosing: Renal ImpairmentAdults:

The FDA-approved labeling contains the following renal dosing adjustment guidelines (maximum: 1 g/dose):

Cl_{cr} 110 mL/minute: Administer 13.9 mg/kg every 24 hours

Cl_{cr} 100 mL/minute: Administer 12.7 mg/kg every 24 hours

Cl_{cr} 80 mL/minute: Administer 10.4 mg/kg every 24 hours

Cl_{cr} 60 mL/minute: Administer 8.2 mg/kg every 24 hours

Cl_{cr} 50 mL/minute: Administer 7 mg/kg every 24 hours **or** 14 mg/kg every 48 hours

Cl_{cr} 40 mL/minute: Administer 5.9 mg/kg every 24 hours **or** 11.7 mg/kg every 48 hours

Cl_{cr} 30 mL/minute: Administer 4.7 mg/kg every 24 hours **or** 9.5 mg/kg every 48 hours **or** 14.2 mg/kg every 72 hours

Cl_{cr} 20 mL/minute: Administer 3.6 mg/kg every 24 hours **or** 7.2 mg/kg every 48 hours **or** 10.7 mg/kg every 72 hours

Cl_{cr} 10 mL/minute: Administer 2.4 mg/kg every 24 hours **or** 4.9 mg/kg every 48 hours **or** 7.3 mg/kg every 72 hours

Cl_{cr} 0 mL/minute: Administer 1.3 mg/kg every 24 hours **or** 2.6 mg/kg every 48 hours **or** 3.9 mg/kg every 72 hours

The following (unlabeled) guidelines may also be used:

MMWR, 2003:

Cl_{cr} ≥30 mL/minute: No adjustment required

Cl_{cr} <30 mL/minute and hemodialysis: 12-15 mg/kg (maximum: 1 g/dose) 2-3 days per week (**NOT** daily)

Aronoff, 2007:

Cl_{cr} ≥10 mL/minute: 1 g every 24 hours

Cl_{cr} <10 mL/minute: 1 g every 48 hours

Hemodialysis: Administer dose after hemodialysis only

Continuous renal replacement therapy (CRRT): 5 mg/kg every 24 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Administer by deep I.M. injection into a large muscle mass.
Administration: I.V.Administer over 60 minutes.
StoragePowder for injection should be stored at room temperature of 15°C to 30°C (59°F to 86°F). Following reconstitution, may store under refrigeration for up to 24 hours.
ReconstitutionDissolve powder with 2 mL of NS or SWFI; allow 2-3 minutes for dissolution.

For I.V. administration: Further dilute in NS 100 mL.

For I.M. administration:

1 g dose: Administer contents of reconstituted vial

<1 g dose: See table:

Capreomycin Dilution for Doses <1 g (I.M. Administration)

Diluent Volume (mL)	**Capreomycin Solution Volume (mL)**	**Final Concentration (approximate)**
2.15	2.85	370 mg/mL
2.63	3.33	315 mg/mL
3.3	4	260 mg/mL
4.3	5	210 mg/mL

ContraindicationsHypersensitivity to capreomycin or any component of the formulation
Warnings/Precautions

Boxed warnings:

- Auditory impairment: See "Disease-related concerns and Concurrent drug therapy issues" below.
- Pediatrics: See "Special populations" below.
- Pregnancy: See "Special populations" below.
- Renal impairment: See "Disease-related concerns and Concurrent drug therapy issues" below.

Concerns related to adverse effects:

- Electrolyte imbalance: Hypocalcemia, hypokalemia, and hypomagnesemia have been reported with use.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Auditory impairment: **[U.S. Boxed Warning]: Use in patients with pre-existing auditory impairment must be undertaken with great caution, and the risk of additional eighth nerve impairment should be weighed against the benefits to be derived from therapy.**
- Renal impairment: **[U.S. Boxed Warning]: Use in patients with renal impairment must be undertaken with great caution, and the risk of additional renal injury should be weighed against the benefits to be derived from therapy.** Dosage reductions are recommended for known or suspected renal impairment.

Concurrent drug therapy issues:

- Drugs with ototoxic or nephrotoxic potential: **[U.S. Boxed Warning]: Use with nonantituberculous drugs (ie, aminoglycoside antibiotics) having ototoxic or nephrotoxic potential should be undertaken only with great caution.**
- Parenteral antituberculous agents: **[U.S. Boxed Warning]: Since other parenteral antituberculous agents (eg, streptomycin) also have similar and sometimes irreversible toxic effects, particularly on eighth cranial nerve and renal function, simultaneous administration of these agents with capreomycin is not recommended.**

Special populations;

- Elderly: Use with caution in the elderly.
- Pediatrics: **[U.S. Boxed Warning]: Safety has not been established in children.**

- Pregnancy: **[U.S. Boxed Warning]: Safety has not been established in pregnant women.**

Geriatric ConsiderationsHas not been studied in the elderly. I.M. administration may limit use due to painful injection or lack of sites in patients with decreased muscle mass. Use with caution in patients with pre-existing hearing impairment due to potential ototoxicity.

Pregnancy Risk FactorC

Pregnancy ConsiderationsCapreomycin has been shown to be teratogenic in animal studies. **[U.S. Boxed Warning]: Safety has not been established in pregnant women**; use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Otic: Ototoxicity (subclinical hearing loss: 11%; clinical loss: 3%)

Renal: Nephrotoxicity (36%, increased BUN)

1% to 10%: Hematologic: Eosinophilia (dose related, mild)

<1%, postmarketing, and/or case reports: Acute tubular necrosis, Bartter's syndrome, creatinine increased, hypersensitivity (maculopapular rash, urticaria and/or fever), hypocalcemia, hypokalemia, hypomagnesemia, injection site reactions (abscess, bleeding, induration and pain), leukocytosis, leukopenia, liver function decreased (BSP excretion decreased), renal injury, thrombocytopenia (rare), tinnitus, toxic nephritis, urinary sediment abnormal, vertigo

Drug Interactions

Aminoglycosides: Capreomycin may enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Capreomycin may enhance the neuromuscular-blocking effect of Colistimethate. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Capreomycin may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Polymyxin B: Capreomycin may enhance the neuromuscular-blocking effect of Polymyxin B. *Risk C: Monitor therapy*

Monitoring ParametersAudiometric measurements and vestibular function at baseline and during therapy; renal function at baseline and weekly during therapy; frequent assessment of serum electrolytes (including calcium, magnesium, and potassium), liver function tests

Reference RangeRecommended concentration for susceptibility testing: 10 mcg/mL

Monitoring: Lab TestsAudiometric measurements and vestibular function at baseline and during therapy; renal function at baseline and weekly during therapy; frequent assessment of serum electrolytes (including calcium, magnesium, and potassium), liver function tests

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sulfate:

Capastat® Sulfate: 1 g

Generic AvailableNo

Mechanism of ActionCapreomycin is a cyclic polypeptide antimicrobial. It is administered as a mixture of capreomycin IA and capreomycin IB. The mechanism of action of capreomycin is not well understood. Mycobacterial species that have become resistant to other agents are usually still sensitive to the action of capreomycin. However, significant cross-resistance with viomycin, kanamycin, and neomycin occurs.

Pharmacodynamics/Kinetics

Half-life elimination: Normal renal function: 4-6 hours; Cl_{cr} 100-110 mL/minute: 5-6 hours; Cl_{cr} 50-80 mL/minute: 7-10 hours; Cl_{cr} 20-40 mL/minute: 12-20 hours; Cl_{cr} 10 mL/minute: 29 hours; Cl_{cr} 0 mL/minute: 55 hours

Time to peak, serum: I.M.: 1-2 hours

Excretion: Urine (52% within 12 hours)

Medication Safety Issues

Sound-alike/look-alike issues:

Zostrix® may be confused with Zestril®, Zovirax®

Pronunciation(kap SAY sin)

U.S. Brand NamesCapzasin-HP® [OTC]; Capzasin-P® [OTC]; DiabetAid Pain and Tingling Relief [OTC]; Zostrix® Neuropathy [OTC]; Zostrix® [OTC]; Zostrix®-HP [OTC]

Canadian Brand NamesZostrix®; Zostrix® H.P.

Pharmacologic CategoryAnalgesic, Topical; Topical Skin Product

Use: Labeled IndicationsTopical treatment of pain associated with postherpetic neuralgia, rheumatoid arthritis, osteoarthritis, diabetic neuropathy; postsurgical pain

Use: Unlabeled/InvestigationalTreatment of pain associated with psoriasis, chronic neuralgias unresponsive to other forms of therapy, and intractable pruritus

Use: DentalPotential use as topical agent in burning mouth syndrome and oral mucositis

Dosing: AdultsTreatment of pain: Topical: Apply to affected area at least 3-4 times/day; application frequency less than 3-4 times/day prevents the total depletion, inhibition of synthesis, and transport of substance P resulting in decreased clinical efficacy and increased local discomfort

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >10 years: Refer to adult dosing.

Administration: TopicalWear gloves to apply; wash hands with soap and water after applying to avoid spreading to eyes or other sensitive areas of the body.

ContraindicationsHypersensitivity to capsaicin or any component of the formulation

Warnings/Precautions

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with eyes. Should not be applied to broken or irritated skin. Affected area should not be tightly bandaged.

Geriatric ConsiderationsCapsaicin products are available over-the-counter. Counsel patients about the appropriate use of these products. The American College of Rheumatology recommends capsaicin for the symptomatic treatment of osteoarthritis of the knee.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Itching, stinging sensation, erythema

Local: Transient burning on application which usually diminishes with repeated use

Respiratory: Cough

Metabolism/Transport Effects**Substrate** of CYP2E1 (minor)

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, topical: 0.025% (60 g); 0.075% (60 g)

Capzasin-P®: 0.025% (45 g)

Zostrix® Neuropathy: 0.25% (60 g) [in Lidocare™ vehicle]

Lotion, topical:

DiabetAid Pain and Tingling Relief: 0.025% (120 mL)

Generic AvailableYes: Cream

Pricing: U.S. (www.drugstore.com)

Cream (Zostrix-HP)

0.075% (56.6): $16.71

Mechanism of ActionInduces release of substance P, the principal chemomediator of pain impulses from the periphery to the CNS, from peripheral sensory neurons; after repeated application, capsaicin depletes the neuron of substance P and prevents reaccumulation

Pharmacodynamics/Kinetics

Onset of action: 14-28 days

Peak effect: 4-6 weeks of continuous therapy

Duration: Several hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Use: Labeled IndicationsManagement of hypertension

Dosing: AdultsHypertension, CHF: May be substituted for previously titrated dosages of the individual components; alternatively, may initiate as follows: Oral:

Initial: Single tablet (captopril 25 mg/hydrochlorothiazide 15 mg) taken once daily; daily dose of captopril should not exceed 150 mg; daily dose of hydrochlorothiazide should not exceed 50 mg

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: Renal ImpairmentMay respond to smaller or less frequent doses.

ContraindicationsHypersensitivity to captopril, any other ACE inhibitor, hydrochlorothiazide, sulfonamide-derived drugs, or any component of the formulation; angioedema or serious hypersensitivity related to previous treatment with an ACE inhibitor; anuria

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required, especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use is contraindicated with previous angioedema associated with ACE inhibitor therapy.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Captopril has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Closely monitor CBC with differential for the first 3 months of therapy and periodically thereafter in these patients. Onset of neutropenia is usually within 3 months of captopril initiation. Neutrophil count generally returns to baseline within 2 weeks of discontinuation.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use captopril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use ACE inhibitors with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Patients with renal impairment may be at increased risk for hematologic toxicity. Avoid hydrochlorothiazide in severe renal disease (ineffective). Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsCombination products are not recommended for first-line treatment and divided doses of diuretics may increase the incidence of nocturia in the elderly.
Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsCaptopril: **Substrate** of CYP2D6 (major)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; in patients with renal impairment and/or collagen vascular disease, closely monitor CBC with differential for the first 3 months of therapy and periodically thereafter.

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; in patients with renal impairment and/or collagen vascular disease, closely monitor CBC with differential for the first 3 months of therapy and periodically thereafter.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

25/15: Captopril 25 mg and hydrochlorothiazide 15 mg

25/25: Captopril 25 mg and hydrochlorothiazide 25 mg

50/15: Captopril 50 mg and hydrochlorothiazide 15 mg

50/25: Captopril 50 mg and hydrochlorothiazide 25 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Capozide)

50-25 mg (30): $95.55

Tablets (Captopril-Hydrochlorothiazide)

25-15 mg (90): $44.99

25-25 mg (90): $44.99

50-15 mg (60): $53.99

50-25 mg (60): $53.99

Mechanism of ActionCaptopril is a competitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. This results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion. Hydrochlorothiazide inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Captopril
- Hydrochlorothiazide

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or insomnia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for captopril and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accomplished reduction in side effects. See Cardiovascular Considerations for individual agents.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Captopril may be confused with Capitrol®, carvedilol

International issues:

Acepril® [Great Britain] may be confused with Accupril® which is a brand name for quinapril in the U.S.

Acepril®: Brand name for enalapril in Hungary and Switzerland; brand name for lisinopril in Denmark

Pronunciation(KAP toe pril)

U.S. Brand NamesCapoten®

Canadian Brand NamesAlti-Captopril; Apo-Capto®; Capoten™; Gen-Captopril; Novo-Captopril; Nu-Capto; PMS-Captopril

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsManagement of hypertension; treatment of heart failure, left ventricular dysfunction after myocardial infarction, diabetic nephropathy

Use: Unlabeled/InvestigationalTo delay the progression of nephropathy and reduce risks of cardiovascular events in hypertensive patients with type 1 or 2 diabetes mellitus; treatment of hypertensive crisis, rheumatoid arthritis; diagnosis of anatomic renal artery stenosis, hypertension secondary to scleroderma renal crisis; diagnosis of aldosteronism, idiopathic edema, Bartter's syndrome, postmyocardial infarction for prevention of ventricular failure; increase circulation in Raynaud's phenomenon, hypertension secondary to Takayasu's disease

Dosing: Adults**Note:** Titrate dose according to patient's response.

Acute hypertension (urgency/emergency): Oral: 12.5-25 mg, may repeat as needed (may be given sublingually, but no therapeutic advantage demonstrated)

Hypertension: Oral: Initial: 12.5-25 mg 2-3 times/day; may increase by 12.5-25 mg/dose at 1- to 2-week intervals up to 50 mg 3 times/day. Maximum: 150 mg 3 times/day. Add diuretic before further dosage increases.

Usual dose range (JNC 7): 25-100 mg/day in 2 divided doses

Congestive heart failure: Oral:

Initial: 6.25-12.5 mg 3 times/day in conjunction with cardiac glycoside and diuretic therapy. Initial dose depends upon patient's fluid/electrolyte status.

Target: 50 mg 3 times/day

Prevention of LV dysfunction following MI: Oral: Initial: 6.25 mg; followed by 12.5 mg 3 times/day; increase to 25 mg 3 times/day over the next few days; following by gradual increase to a goal of 50 mg 3 times/day (Some dosage schedules increase the dosage more aggressively to achieve goal dosage within the first few days of initiation).

Diabetic nephropathy: Oral:

25 mg 3 times/day. May be taken with other antihypertensive therapy if required to further lower blood pressure.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Titrate dose according to patient's response.

Hypertension: Oral:

Infants: Initial: 0.15-0.3 mg/kg/dose; titrate dose upward to maximum of 6 mg/kg/day in 1-4 divided doses; usual required dose: 2.5-6 mg/kg/day

Children: Initial: 0.5 mg/kg/dose; titrate upward to maximum of 6 mg/kg/day in 2-4 divided doses.

Older Children: Initial: 6.25-12.5 mg/dose every 12-24 hours; titrate upward to maximum of 6 mg/kg/day.

Adolescents: Initial: 12.5-25 mg/dose given every 8-12 hours; increase by 25 mg/dose to maximum of 450 mg/day.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 75% of normal dose.

Cl_{cr} <10 mL/minute: Administer 50% of normal dose.

Note: Smaller dosages given every 8-12 hours are indicated in patients with renal dysfunction. Renal function and leukocyte count should be carefully monitored during therapy.

Hemodialysis effects: Moderately dialyzable (20% to 50%); administer dose postdialysis or administer 25% to 35% supplemental dose.

Peritoneal dialysis: Supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralUnstable in aqueous solutions; to prepare solution for oral administration, mix prior to administration and use within 10 minutes.

Dietary ConsiderationsShould be taken at least 1 hour before or 2 hours after eating.

Extemporaneously PreparedCaptopril has limited stability in aqueous preparations. The addition of an antioxidant (sodium ascorbate) has been shown to increase the stability of captopril in solution; captopril (1 mg/mL) in syrup with methylcellulose is stable for 7 days stored either at 4°C or 22°C; captopril (1 mg/mL) in distilled water (no additives) is stable for 14 days if stored at 4°C and 7 days if stored at 22°C; captopril (1 mg/mL) with sodium ascorbate (5 mg/mL) in distilled water is stable for 56 days at 4°C and 14 days at 22°C.

Captopril (0.75 mg/mL) in cherry syrup is stable for only 2 days in amber clear plastic containers stored at room temperature or under refrigeration; captopril (0.75 mg/mL) in either a 1:1 mixture of Ora-Sweet® and Ora-Plus® or a 1:1 mixture of Ora-Sweet® SF and Ora-Plus® is stable for 10 days or less depending on the storage temperature (see Allen, 1996).

Powder papers can also be made; powder papers are stable for 12 weeks when stored at room temperature

Allen LV and Erickson III MA, “Stability of Baclofen, Captopril, Diltiazem Hydrochloride, Dipyridamole, and Flecainide Acetate in Extemporaneously Compounded Oral Liquids,” *Am J Health Syst Pharm*, 1996, 53:2179-84.

Nahata MC, Morosco RS, and Hipple TF, “Stability of Captopril in Three Liquid Dosage Forms,” *Am J Hosp Pharm*, 1994, 51(1):95-6.

Taketomo CK, Chu SA, Cheng MH, et al, “Stability of Captopril in Powder Papers Under Three Storage Conditions,” *Am J Hosp Pharm*, 1990, 47(8):1799-1801.

ContraindicationsHypersensitivity to captopril, any other ACE inhibitor, or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Captopril has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Closely monitor CBC with differential for the first 3 months of therapy and periodically thereafter in these patients. Onset of neutropenia is usually within 3 months of captopril initiation. Neutrophil count generally returns to baseline within 2 weeks of discontinuation.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric Considerations Due to frequent decreases in glomerular filtration (also Cl_{cr}) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with congestive heart failure and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk Factor C (1st trimester); D (2nd and 3rd trimesters)

Pregnancy Considerations Due to adverse events observed in some animal studies, captopril is considered pregnancy category C during the first trimester. Based on human data, captopril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). Captopril crosses the placenta and may affect ACE activity in the fetus. First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

Lactation Enters breast milk/not recommended (AAP rates "compatible")

Breast-Feeding Considerations Captopril is excreted in breast milk. Breast-feeding is not recommended by the manufacturer. The American Academy of Pediatrics considers captopril to be "usually compatible with breast-feeding."

Pregnancy & Lactation, In-Depth

- Captopril in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Cardiovascular: Hypotension (1% to 3%), tachycardia (1%), chest pain (1%), palpitation (1%)

Dermatologic: Rash (maculopapular or urticarial) (4% to 7%), pruritus (2%); in patients with rash, a positive ANA and/or eosinophilia has been noted in 7% to 10%.

Endocrine & metabolic: Hyperkalemia (1% to 11%)

Hematologic: Neutropenia may occur in up to 4% of patients with renal insufficiency or collagen-vascular disease.

Renal: Proteinuria (1%), serum creatinine increased, worsening of renal function (may occur in patients with bilateral renal artery stenosis or hypovolemia)

Respiratory: Cough (<1% to 2%)

Miscellaneous: Hypersensitivity reactions (rash, pruritus, fever, arthralgia, and eosinophilia) have occurred in 4% to 7% of patients (depending on dose and renal function); dysgeusia - loss of taste or diminished perception (2% to 4%)

Frequency not defined:

Cardiovascular: Angioedema, cardiac arrest, cerebrovascular insufficiency, rhythm disturbances, orthostatic hypotension, syncope, flushing, pallor, angina, MI, Raynaud's syndrome, CHF

Central nervous system: Ataxia, confusion, depression, nervousness, somnolence

Dermatologic: Bullous pemphigus, erythema multiforme, Stevens-Johnson syndrome, exfoliative dermatitis

Endocrine & metabolic: Alkaline phosphatase increased, bilirubin increased, gynecomastia

Gastrointestinal: Pancreatitis, glossitis, dyspepsia

Genitourinary: Urinary frequency, impotence

Hematologic: Anemia, thrombocytopenia, pancytopenia, agranulocytosis, anemia

Hepatic: Jaundice, hepatitis, hepatic necrosis (rare), cholestasis, hyponatremia (symptomatic), transaminases increased

Neuromuscular & skeletal: Asthenia, myalgia, myasthenia

Ocular: Blurred vision

Renal: Renal insufficiency, renal failure, nephrotic syndrome, polyuria, oliguria

Respiratory: Bronchospasm, eosinophilic pneumonitis, rhinitis

Miscellaneous: Anaphylactoid reactions

<1% (Limited to important or life-threatening; frequency ≤ to placebo): Gastric irritation, abdominal pain, nausea, vomiting, diarrhea, anorexia, constipation, aphthous ulcers, peptic ulcer, dizziness, headache, malaise, fatigue, insomnia, xerostomia, dyspnea, alopecia, paresthesia, angina, glomerulonephritis, cholestatic jaundice, psoriasis, hyperthermia, myalgia, arthralgia

Postmarketing and/or case reports: Aplastic anemia, hemolytic anemia, bronchospasm, alopecia, systemic lupus erythematosus, Kaposi's sarcoma, pericarditis, exacerbations of Huntington's disease, Guillain-Barré syndrome, seizure (in premature infants). A syndrome which may include fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia, and elevated ESR has been reported for captopril and other ACE inhibitors.

Metabolism/Transport Effects **Substrate** of CYP2D6 (major)
Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Captopril serum concentrations may be decreased if taken with food. Long-term use of captopril may result in a zinc deficiency which can result in a decrease in taste perception.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, california poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Test InteractionsPositive Coombs' [direct]; may cause false-positive results in urine acetone determinations using sodium nitroprusside reagent

Monitoring ParametersBUN, electrolytes, serum creatinine; blood pressure. In patients with renal impairment and/or collagen vascular disease, closely monitor CBC with differential for the first 3 months of therapy and periodically thereafter.

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions (especially anything that may impact renal function). Patient should be closely monitored when beginning therapy (anaphylactic reaction or severe angioedema can occur). Assess results of laboratory tests (renal function), therapeutic effectiveness (blood pressure), and adverse response (eg, hypovolemia, angioedema, postural hypotension) when beginning therapy, adjusting dosage, and on a regular basis during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBUN, electrolytes, serum creatinine; in patients with renal impairment and/or collagen vascular disease, closely monitor CBC with differential for the first 3 months of therapy and periodically thereafter

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Do not use potassium supplement or salt substitutes without consulting prescriber. Take exactly as directed; do not discontinue this medication without consulting prescriber. Take first dose at bedtime. Take all doses on an empty stomach, 1 hour before or 2 hours after meals. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); or nausea, vomiting, abdominal pain, dry mouth, or transient loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report immediately swelling or numbness of face, mouth, or throat; unusual chest pain or palpitations; decreased urinary output; fever or chills; swelling of extremities; skin rash; numbness, tingling, or pain in muscles; respiratory difficulty or unusual cough; and other persistent adverse reactions. **Pregnancy precautions** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 12.5 mg, 25 mg, 50 mg, 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Capoten)

100 mg (60): $240.90

Tablets (Captopril)

12.5 mg (100): $11.99

25 mg (90): $13.99

50 mg (100): $15.67

100 mg (90): $19.99

Mechanism of ActionCompetitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion

Pharmacodynamics/Kinetics

Onset of action: Peak effect: Blood pressure reduction: 1-1.5 hours after dose

Duration: Dose related, may require several weeks of therapy before full hypotensive effect

Absorption: 60% to 75%; reduced 30% to 40% by food

Protein binding: 25% to 30%

Metabolism: 50%

Half-life elimination (renal and cardiac function dependent):

Adults, healthy volunteers: 1.9 hours; Heart failure: 2.06 hours; Anuria: 20-40 hours

Time to peak: 1 hour

Excretion: Urine (>95%) within 24 hours (40% to 50% as unchanged drug)

Related Information

- Angiotensin Agents
- Antacid Drug Interactions
- Heart Failure (Systolic)
- Hypertension

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Loss or diminished perception of taste and orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or insomnia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after 4 years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Anesthesia and Critical Care Concerns/Other ConsiderationsSevere hypotension may occur in patients who are sodium and/or volume depleted.

ACE inhibitors are indicated in patients postmyocardial infarction in whom left ventricular ejection fraction is <40%. When used in patients with heart failure, the target dose of 50 mg 3 times/day should be achieved, if possible. Lower daily doses of ACE inhibitors have not demonstrated the same cardioprotective effects.

ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Medication Safety Issues

Sound-alike/look-alike issues:

Isopto® Carbachol may be confused with Isopto® Carpine

Pronunciation(KAR ba kole)

U.S. Brand NamesIsopto® Carbachol; Miostat®

Canadian Brand NamesIsopto® Carbachol; Miostat®

Pharmacologic CategoryCholinergic Agonist; Ophthalmic Agent, Antiglaucoma; Ophthalmic Agent, Miotic

Use: Labeled IndicationsLowers intraocular pressure in the treatment of glaucoma; cause miosis during surgery

Dosing: Adults

Glaucoma: Ophthalmic: Instill 1-2 drops up to 3 times/day

Ophthalmic surgery (miosis): Intraocular: 0.5 mL instilled into anterior chamber before or after securing sutures

Dosing: ElderlyRefer to adult dosing.

Administration: Other

Ophthalmic: Finger pressure should be applied on the lacrimal sac for 1-2 minutes following topical instillation; remove excess around the eye with a tissue.

Intraocular: Instillation for miosis prior to eye surgery should be gentle and parallel to the iris face and tangential to the pupil border; discard unused portion. Do not inject >0.5 mL into the anterior chamber. Instillation may occur before or after securing sutures. Sterile technique must be used.

Storage

Intraocular: Store at room temperature of 15°C to 30°C (59°F to 86°F).

Topical: Store at 8°C to 27°C (46°F to 80°F).

ContraindicationsHypersensitivity to carbachol or any component of the formulation; acute iritis, acute inflammatory disease of the anterior chamber

Warnings/Precautions

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Corneal abrasion: Use with caution in the presence of corneal abrasion.
- Gastrointestinal disease: Use with caution in patients with peptic ulcer disease or gastrointestinal spasm.
- Heart failure: Use with caution in patients with acute heart failure.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Parkinson's disease: Use with caution in patients with Parkinson's disease.
- Urinary tract obstruction: Use with caution in patients with urinary tract obstruction.

Concurrent drug therapy issues:

- General anesthesia: Use with caution in patients undergoing general anesthesia.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsAssess patient's ability to self-administer.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, flushing, hypotension, syncope

Central nervous system: Headache

Gastrointestinal: Abdominal cramps, diarrhea, epigastric distress, salivation, vomiting

Genitourinary: Urinary bladder tightness

Ocular: Bullous keratopathy, burning (transient), ciliary spasm, conjunctival injection, corneal clouding, irritation, postoperative iritis (following cataract extraction), retinal detachment, stinging (transient)

Respiratory: Asthma

Miscellaneous: Diaphoresis

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Patient EducationMay sting on instillation. May cause headache, altered distance vision, and decreased night vision. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, intraocular:

Miostat®): 0.01% (1.5 mL)

Solution, ophthalmic:

Isopto® Carbachol: 1.5% (15 mL); 3% (15 mL) [contains benzalkonium chloride]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Isopto Carbachol)

1.5% (15): $44.08

3% (15): $55.99

Mechanism of ActionSynthetic direct-acting cholinergic agent that causes miosis by stimulating muscarinic receptors in the eye

Pharmacodynamics/Kinetics

Ophthalmic instillation:

Onset of action: Miosis: 10-20 minutes

Duration: Reduction in intraocular pressure: 4-8 hours

Intraocular administration:

Onset of action: Miosis: 2-5 minutes

Duration: 24 hours

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Increased salivation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCarbacholine; Carbamylcholine Chloride

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Carbamazepine Genetic Testing for Susceptibility to Serious Skin Reactions - December 2007; Health Canada Update - March 2008

The U.S. Food and Drug Administration (FDA) and Health Canada have alerted their respective healthcare professionals of changes to the prescribing information, including a new boxed warning, for carbamazepine products (Tegretol®, Carbatrol®, Equetro®) regarding the potential for serious, and potentially fatal, skin reactions in susceptible patients. Individuals who possess a genetic susceptibility marker known as the *HLA-B*1502* allele have an increased risk of developing Stevens-Johnson syndrome (SJS) and/or toxic epidermal necrolysis (TEN) (usually manifests within first few months of treatment) compared to persons without this genotype. The presence of this genetic variant exists in up to 15% of people of Asian descent, varying from <1% in Japanese and Koreans, to 2% to 4% of South Asians and Indians, to 10% to 15% of populations from China, Taiwan, Malaysia, and the Philippines. This variant is virtually absent in those of Caucasian, African-American, Hispanic, or European ancestry. Risk assessments have suggested that incidence of SJS/TEN in Asians could be ~60 cases/10,000 new users depending on the country of origin (a nearly 10-fold higher incidence than in predominantly Caucasian populations). Presence of the *HLA-B*1502* allele may signify greater risk of developing SJS/TEN with other antiepileptic agents for which this degree of dermatologic reactions has been documented.

The manufacturers of these products now recommend genetic testing prior to initiation of therapy in most patients of Asian ancestry for the presence of this genetic marker. A positive result should preclude use of carbamazepine, unless the benefit exceeds risk. Patients with negative results are much less likely to develop a serious skin reaction, though careful monitoring is prudent. Patients (including those previously determined to harbor the *HLA-B*1502* allele) currently tolerating carbamazepine for several months are likely at a very low risk of developing these reactions.

Additional information, including a copy of the revised prescribing information can be found at:

http://www.fda.gov/cder/drug/infopage/carbamazepine/default.htm

http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/2008/tegretol_hpc-cps_e.html

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - February 2008

The U.S. Food and Drug Administration (FDA) is informing healthcare professionals of an increased risk of suicidality (suicidal behavior or ideation) observed from analysis of clinical studies using various antiepileptic medications compared to placebo. The analysis was performed on 199 placebo-controlled studies involving 43,892 patients (27,863 treated patients versus 16,029 placebo patients) aged ≥5 years receiving one of the following 11 drugs: carbamazepine (Carbatrol®, Equetro®, Tegretol®, Tegretol® XR), felbamate (Felbatol®), gabapentin (Neurontin®), lamotrigine (Lamictal®), levetiracetam (Keppra®), oxcarbazepine (Trileptal®), pregabalin (Lyrica®), tiagabine (Gabitril®), topiramate (Topamax®), valproate (Depakote®, Depakote® ER, Depakene®, Depacon®), and zonisamide (Zonegran®). Studies examined medication efficacy in a variety of disorders, including epilepsy, psychiatric disorders (eg, depression, bipolar disorder), and other conditions (eg, migraine, neuropathic pain). According to the FDA, the results revealed a statistically significant increased risk of suicidality in 0.43% treated patients compared to 0.22% placebo patients, or an estimated 2.1 per 1000 (95% CI: 0.7, 4.2) more patients in the treated groups relative to placebo. This increased risk was reported anywhere from 1 week of therapy through 24 weeks. However, most trials were ≤24 weeks duration and the risk of suicide extending beyond 24 weeks is currently unknown. The relative risk of suicidal behavior or ideation in the treated patients was higher for patients with epilepsy (RR=3.6) compared to patients treated for psychiatric (RR=1.6) or other conditions

(RR=2.3). Overall, the incidence of suicidal behavior or ideation occurred consistently across all demographic subgroups and with each of the drugs studied. Of note, four patients receiving an antiepileptic committed suicide relative to none in the placebo groups.

Forthcoming product labeling changes are likely to extend to all antiepileptic drugs and not limited to the drugs used in the studies, pending discussions scheduled for the upcoming advisory committee meeting. Healthcare professionals and family members/caregivers are encouraged to monitor patients receiving any antiepileptic medication for signs/symptoms of suicidality (eg, anxiety, depression, behavior changes). Patients should not stop taking their antiepileptic therapy unless advised by a healthcare professional.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

CarBAMazepine may be confused with OXcarbazepine

Carbatrol® may be confused with Cartrol®

Epitol® may be confused with Epinal®

Tegretol®, Tegretol®-XR may be confused with Mebaral®, Tegrin®, Toprol-XL®, Toradol®, Trental®

Pronunciation(kar ba MAZ e peen)

U.S. Brand NamesCarbatrol®; Epitol®; Equetro®; Tegretol®; Tegretol®-XR

Canadian Brand NamesApo-Carbamazepine®; Bio-Carbamazepine; Carbamazepine; Dom-Carbamazepine; Gen-Carbamazepine CR; Mapezine®; Novo-Carbamaz; Nu-Carbamazepine; PHL-Carbamazepine; PMS-Carbamazepine; Sandoz-Carbamazepine; Taro-Carbamazepine Chewable; Tegretol®

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled Indications

Carbatrol®, Tegretol®, Tegretol®-XR: Partial seizures with complex symptomatology (psychomotor, temporal lobe), generalized tonic-clonic seizures (grand mal), mixed seizure patterns, trigeminal neuralgia

Equetro®: Acute manic and mixed episodes associated with bipolar 1 disorder

Use: Unlabeled/InvestigationalTreatment of resistant schizophrenia, ethanol withdrawal, restless leg syndrome, post-traumatic stress disorders

Use: DentalPain relief of trigeminal or glossopharyngeal neuralgia

Dosing: AdultsDosage must be adjusted according to patient's response and serum concentrations. Administer tablets (chewable or conventional) in 2-3 divided doses daily and suspension in 4 divided doses daily. Oral:

Epilepsy: Initial: 400 mg/day in 2 divided doses (tablets or extended release tablets) or 4 divided doses (oral suspension); increase by up to 200 mg/day at weekly intervals using a twice daily regimen of extended release tablets or capsules, or a 3-4 times/day regimen of other formulations until optimal response and therapeutic levels are achieved; usual dose: 800-1200 mg/day

Maximum recommended dose: 1600 mg/day; however, some patients have required up to 1.6-2.4 g/day

Trigeminal or glossopharyngeal neuralgia: Initial: 200 mg/day in 2 divided doses (tablets, extended release tablets, or extended release capsules) or 4 divided doses (oral suspension) with food, gradually increasing in increments of 200 mg/day as needed.

Maintenance: Usual: 400-800 mg daily in 2 divided doses (tablets, extended release tablets, or extended release capsules) or 4 divided doses (oral suspension); maximum dose: 1200 mg/day

Bipolar disorder: Initial: 400 mg/day in 2 divided doses (tablets, extended release tablets, or extended release capsules) or 4 divided doses (oral suspension), may adjust by 200 mg/day increments; maximum dose: 1600 mg/day.

Note: Equetro® is the only formulation specifically approved by the FDA for the management of bipolar disorder.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDosage must be adjusted according to patient's response and serum concentrations. Administer tablets (chewable or conventional) in 2-3 divided doses daily and suspension in 4 divided doses daily.

Epilepsy: Oral:

Children <6 years: Initial: 10-20 mg/kg/day divided twice or 3 times daily as tablets or 4 times/day as suspension; increase dose every week until optimal response and therapeutic levels are achieved

Maintenance dose: Divide into 3-4 doses daily (tablets or suspension); maximum recommended dose: 35 mg/kg/day

Children 6-12 years: Initial: 200 mg/day in 2 divided doses (tablets or extended release tablets) or 4 divided doses (oral suspension); increase by up to 100 mg/day at weekly intervals using a twice daily regimen of extended release tablets or 3-4 times daily regimen of other formulations until optimal response and therapeutic levels are achieved

Maintenance: Usual: 400-800 mg/day; maximum recommended dose: 1000 mg/day

Note: Children <12 years who receive ≥400 mg/day of carbamazepine may be converted to extended release capsules (Carbatrol®) using the same total daily dosage divided twice daily

Children >12 years: Refer to adult dosing.

Maximum recommended doses:

Children 12-15 years: 1000 mg/day

Children >15 years: 1200 mg/day

Administration: Oral

Suspension: Must be given on a 3-4 times/day schedule versus tablets which can be given 2-4 times/day. Since a given dose of suspension will produce higher peak and lower trough levels than the same dose given as the tablet form, patients given the suspension should be started on lower doses given more frequently (same total daily dose) and increased slowly to avoid unwanted side effects. When carbamazepine suspension has been combined with chlorpromazine or thioridazine solutions, a precipitate forms which may result in loss of effect. Therefore, it is recommended that the carbamazepine suspension dosage form not be administered at the same time with other liquid medicinal agents or diluents. Should be administered with meals.

Extended release capsule (Carbatrol®, Equetro®): Consists of three different types of beads: Immediate release, extended-release, and enteric release. The bead types are combined in a ratio to allow twice daily dosing. May be opened and contents sprinkled over food such as a teaspoon of applesauce; may be administered with or without food; do not crush or chew.

Extended release tablet: Should be inspected for damage. Damaged extended release tablets (without release portal) should not be administered. Should be administered with meals; swallow whole, do not crush or chew.

Dietary ConsiderationsDrug may cause GI upset, take with large amount of water or food to decrease GI upset. May need to split doses to avoid GI upset.

ContraindicationsHypersensitivity to carbamazepine, tricyclic antidepressants, or any component of the formulation; bone marrow depression; with or within 14 days of MAO inhibitor use; concurrent use of nefazodone

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Blood dyscrasias: See “Concerns related to adverse effects” below.
- Dermatologic reactions: See “Special populations” below.

Concerns related to adverse effects:

- Blood dyscrasias: **[U.S. Boxed Warning]: Potentially fatal blood cell abnormalities have been reported following treatment.** A spectrum of hematologic effects has been reported with use (eg, agranulocytosis, aplastic anemia, neutropenia, leukopenia, thrombocytopenia, pancytopenia, and anemias); patients with a previous history of adverse hematologic reaction to any drug may be at increased risk. Early detection of hematologic change is important; advise patients of early signs and symptoms including fever, sore throat, mouth ulcers, infections, easy bruising, petechial or purpuric hemorrhage.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Dermatologic reactions: Severe reactions, including toxic epidermal necrolysis and Stevens-Johnson syndromes, although rarely reported, have resulted in fatalities; use caution and screen for genetic susceptibility in Asian patients (see "Special populations" below); drug should be discontinued if there are any signs of hypersensitivity.
- Multiorgan hypersensitivity reactions: Potentially serious, sometimes fatal multiorgan hypersensitivity reactions have been reported with some antiepileptic drugs; monitor for signs and symptoms of possible disparate manifestations associated with lymphatic, hepatic, renal, and/or hematologic organ systems; gradual discontinuation and conversion to alternate therapy may be required.
- Psychiatric effects: May activate latent psychosis and/or cause confusion or agitation; elderly patients may be at an increased risk for psychiatric effects.

Disease-related concerns:

- Anticholinergic sensitivity: Has mild anticholinergic activity; use with caution in patients with sensitivity to anticholinergic effects (urinary retention, increased intraocular pressure, constipation).
- Cardiovascular disease: May cause conduction abnormalities; use caution in patients with underlying EKG abnormalities, pre-existing cardiac damage, or patients who are at risk for conduction abnormalities.
- Hepatic impartment: Use with caution in patients with hepatic impairment or history of hepatic porphyria; rare cases of hepatic failure have been reported.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 induces or inhibitors. Carbamazepine may significantly induce many CYP450 enzymes, including 1A2, 2B6, 2C9, 2C19, and 3A4; use with caution with medications significantly metabolized through these pathways.
- Nefazodone: Coadministration yields insufficient plasma levels of nefazodone to achieve a therapeutic effect; concurrent use is

contraindicated.

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Asian ancestry: **[U.S. Boxed Warning]: Patients of Asian descent should be screened for the variant _HLA-B*1502_** allele prior to initiating therapy. This genetic variant has been associated with a significantly increased risk of developing Stevens-Johnson syndrome and/or toxic epidermal necrolysis. Patients with a positive result should not be started on carbamazepine.

- Elderly: There may be an increased risk of SIADH-like syndrome in the elderly; may activate latent psychosis, confusion, or agitation.

- Pediatrics: Exacerbation of certain seizure types have been seen after initiation of therapy in children with mixed seizure disorders.

Dosage form specific issues:

- Suspension: Administration of the suspension will yield higher peak and lower trough serum levels than an equal dose of the tablet form; consider a lower starting dose given more frequently (same total daily dose) when using the suspension.

Other warnings/precautions:

- Appropriate use: Not effective in absence, myoclonic, or akinetic seizures; carbamazepine administration may increase the frequency of seizures in patients with these types of seizures

- Bipolar disorder use: The smallest effective dose is suggested for use in bipolar disorder to reduce the risk for overdose/suicide; high-risk patients should be monitored for suicidal ideations. Prescription should be written for the smallest quantity consistent with good patient care. Actuation of latent psychosis is possible.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsElderly may have increased risk of SIADH-like syndrome. Elderly are more susceptible to carbamazepine-induced confusion and agitation, AV block, and bradycardia.

Pregnancy Risk FactorD

Pregnancy ConsiderationsCrosses the placenta. Dysmorphic facial features, cranial defects, cardiac defects, spina bifida, IUGR, and multiple other malformations reported. Epilepsy itself, number of medications, genetic factors, or a combination of these probably influences the teratogenicity of anticonvulsant therapy. Benefit:risk ratio usually favors continued use during pregnancy and breast-feeding. Contraceptives may be rendered less effective by the coadministration of carbamazepine; alternative methods of contraception should be considered.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsCarbamazepine and its metabolites are found in breast milk. The manufacturer does not recommend use while breast-feeding. However, AAP rates this medication "compatible" in breast-feeding.

Adverse ReactionsFrequency not defined, unless otherwise specified.

Cardiovascular: Arrhythmias, AV block, bradycardia, chest pain (bipolar use), CHF, edema, hyper-/hypotension, lymphadenopathy, syncope, thromboembolism, thrombophlebitis

Central nervous system: Amnesia (bipolar use), anxiety (bipolar use), aseptic meningitis (case report), ataxia (bipolar use 15%), confusion, depression (bipolar use), dizziness (bipolar use 44%), fatigue, headache (bipolar use 22%), sedation, slurred speech, somnolence (bipolar use 32%)

Dermatologic: Alopecia, alterations in skin pigmentation, erythema multiforme, exfoliative dermatitis, photosensitivity reaction, pruritus (bipolar use 8%), purpura, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Chills, fever, hyponatremia, syndrome of inappropriate ADH secretion (SIADH)

Gastrointestinal: Abdominal pain, anorexia, constipation, diarrhea, dyspepsia (bipolar use), gastric distress, nausea (bipolar use 29%), pancreatitis, vomiting (bipolar use 18%), xerostomia (bipolar use)

Genitourinary: Azotemia, impotence, renal failure, urinary frequency, urinary retention

Hematologic: Acute intermittent porphyria, agranulocytosis, aplastic anemia, bone marrow suppression, eosinophilia, leukocytosis, leukopenia, pancytopenia, thrombocytopenia

Hepatic: Abnormal liver function tests, hepatic failure, hepatitis, jaundice

Neuromuscular & skeletal: Back pain, pain (bipolar use 12%), peripheral neuritis, weakness

Ocular: Blurred vision, conjunctivitis, lens opacities, nystagmus

Otic: Hyperacusis, tinnitus

Miscellaneous: Diaphoresis, hypersensitivity (including multiorgan reactions, may include disorders mimicking lymphoma, eosinophilia, hepatosplenomegaly, vasculitis); infection (bipolar use 12%)

Postmarketing and/or case reports: Suicidal ideation

Metabolism/Transport Effects**Substrate** of CYP2C8 (minor), 3A4 (major); **Induces** CYP1A2 (strong), 2B6 (strong), 2C8 (strong), 2C9 (strong), 2C19 (strong), 3A4 (strong)

Drug Interactions

Acetaminophen: CarBAMazepine may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Allopurinol: May increase the serum concentration of CarBAMazepine. *Risk C: Monitor therapy*

Aminocamptothecin: CarBAMazepine may decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Aripiprazole: CarBAMazepine may decrease the serum concentration of Aripiprazole. *Risk D: Consider therapy modification*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): CarBAMazepine may increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Dihydropyridine): CarBAMazepine may increase the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of CarBAMazepine. CarBAMazepine may increase the metabolism of Calcium Channel Blockers (Nondihydropyridine). *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May increase the serum concentration of CarBAMazepine. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Cimetidine: May increase the serum concentration of CarBAMazepine. The serum carbamazepine concentration might return to normal within one week of starting cimetidine. *Risk C: Monitor therapy*

ClomiPRAMINE: CarBAMazepine may increase the serum concentration of ClomiPRAMINE. *Risk C: Monitor therapy*

Clozapine: CarBAMazepine may increase the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): CarBAMazepine may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CycloSPORINE: CarBAMazepine may decrease the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Danazol: May decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Darunavir: CarBAMazepine may decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: CarBAMazepine may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Doxycycline: CarBAMazepine may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etravirine: CarBAMazepine may decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination. *Risk X: Avoid combination*

Fluconazole: May decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Flunarizine: CarBAMazepine may decrease the serum concentration of Flunarizine. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Haloperidol: CarBAMazepine may increase the metabolism of Haloperidol. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Isoniazid: May decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Lacosamide: CarBAMazepine may decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

LamoTRIgine: May enhance the adverse/toxic effect of CarBAMazepine. CarBAMazepine may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Lithium: CarBAMazepine may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of CarBAMazepine. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mebendazole: CarBAMazepine may decrease the serum concentration of Mebendazole. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Methadone: CarBAMazepine may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Methylfolate: May decrease the serum concentration of CarBAMazepine. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): CarBAMazepine may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Paliperidone: CarBAMazepine may decrease the serum concentration of Paliperidone. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: CarBAMazepine may increase the metabolism of Phenytoin. Phenytoin may increase the metabolism of CarBAMazepine. CarBAMazepine may decrease the metabolism of Phenytoin. Possibly by competitive inhibition at sites of metabolism. *Risk D: Consider therapy modification*

Propoxyphene: May decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Protease Inhibitors: CarBAMazepine may increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Risperidone: CarBAMazepine may decrease the serum concentration of Risperidone. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of CarBAMazepine. CarBAMazepine may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Temsirolimus: CarBAMazepine may decrease the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are also likely to be decreased (and maybe to an even greater degree). Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as carbamazepine; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Theophylline Derivatives: CarBAMazepine may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thyroid Products: CarBAMazepine may decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Topiramate: CarBAMazepine may decrease the serum concentration of Topiramate. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: CarBAMazepine may increase the metabolism of Tricyclic Antidepressants. **Exceptions:** ClomiPRAMINE. *Risk C: Monitor therapy*

Valproic Acid: CarBAMazepine may increase the metabolism of Valproic Acid. Valproic Acid may decrease the serum concentration of CarBAMazepine. Carbamazepine-Epoxide concentrations might increase, offsetting the decreases in the parent compound. *Risk C: Monitor therapy*

Vecuronium: CarBAMazepine may decrease the serum concentration of Vecuronium. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): CarBAMazepine may decrease the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: CarBAMazepine may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ziprasidone: CarBAMazepine may increase the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Carbamazepine serum levels may be increased if taken with food. Carbamazepine serum concentration may be increased if taken with grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsMay interact with some pregnancy tests; increased BUN, AST, ALT, bilirubin, alkaline phosphatase (S); decreased calcium, T_3, T_4, sodium (S)

Monitoring ParametersCBC with platelet count, reticulocytes, serum iron, lipid panel, liver function tests, urinalysis, BUN, serum carbamazepine levels, thyroid function tests, serum sodium; pregnancy test; ophthalmic exams (pupillary reflexes); observe patient for excessive sedation, especially when instituting or increasing therapy; signs of rash; *HLA-B*1502* genotype screening prior to therapy initiation in patients of Asian descent.

Reference Range

Timing of serum samples: Absorption is slow, peak levels occur 6-8 hours after ingestion of the first dose; the half-life ranges from 8-60 hours, therefore, steady-state is achieved in 2-5 days

Therapeutic levels: 4-12 mcg/mL (SI: 17-51 µmol/L)

Toxic concentration: >15 mcg/mL; patients who require higher levels of 8-12 mcg/mL (SI: 34-51 µmol/L) should be watched closely. Side effects including CNS effects occur commonly at higher dosage levels. If other anticonvulsants are given therapeutic range is 4-8 mcg/mL.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Observe and teach seizure/safety precautions. Monitor for mental and CNS changes, excessive sedation (especially when initiating or increasing therapy), suicide ideation. Baseline and periodic eye exams (slit lamp, funduscopy, and tonometry) are recommended. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC with platelet count, reticulocytes, serum iron, liver function tests, urinalysis, BUN, serum carbamazepine levels, thyroid function tests, serum sodium; pregnancy test; signs of rash; *HLA-B*1502* genotype screening prior to therapy initiation in patients of Asian descent.

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue this medication without consulting prescriber. Do not use extended release tablets which have been damaged or crushed. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Avoid grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, loss of appetite, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Wear identification of epileptic status and medications. Report CNS changes, suicide ideation, mentation changes, suicidal ideation, depression, or changes in cognition; muscle cramping, weakness, tremors, sore throat, mouth ulcers, swollen glands, fever, jaundice, changes in gait; persistent GI symptoms (cramping, constipation, vomiting, anorexia); rash or skin irritations; unusual bruising or bleeding (mouth, urine, stool); or worsening of seizure activity, or loss of seizure control. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

Carbatrol®, Equetro®: 100 mg, 200 mg, 300 mg

Suspension, oral: 100 mg/5 mL (5 mL, 10 mL, 450 mL)

Tegretol®: 100 mg/5 mL (450 mL) [contains propylene glycol; citrus vanilla flavor]

Tablet: 200 mg

Epitol®, Tegretol®: 200 mg

Tablet, chewable: 100 mg

Tegretol®: 100 mg

Tablet, extended release:

Tegretol®-XR: 100 mg, 200 mg, 400 mg

Generic AvailableYes: Excludes capsule (extended release), tablet (extended release)

Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Carbatrol)

100 mg (30): $45.99

200 mg (60): $86.66

300 mg (60): $82.00

Capsule, 12-hour (Equetro)

100 mg (60): $78.61

200 mg (60): $97.19

300 mg (60): $120.05

Chewable (Carbamazepine)

100 mg (60): $12.99

Chewable (Tegretol)

100 mg (60): $35.99

Suspension (Carbamazepine)

100 mg/5 mL (450): $28.26

Suspension (Tegretol)

100 mg/5 mL (450): $58.28

Tablet, 12-hour (Tegretol XR)

100 mg (30): $23.99

200 mg (30): $35.99

400 mg (30): $57.14

Tablets (Carbamazepine)

200 mg (90): $13.99

Tablets (Tegretol)

200 mg (60): $56.99

Mechanism of ActionIn addition to anticonvulsant effects, carbamazepine has anticholinergic, antineuralgic, antidiuretic, muscle relaxant, antimanic, antidepressive, and antiarrhythmic properties; may depress activity in the nucleus ventralis of the thalamus or decrease synaptic transmission or decrease summation of temporal stimulation leading to neural discharge by limiting influx of sodium ions across cell membrane or other unknown mechanisms; stimulates the release of ADH and potentiates its action in promoting reabsorption of water; chemically related to tricyclic antidepressants

Pharmacodynamics/Kinetics

Absorption: Slow

Distribution: V_d: Neonates: 1.5 L/kg; Children: 1.9 L/kg; Adults: 0.59-2 L/kg

Protein binding: Carbamazepine: 75% to 90%, may be decreased in newborns; Epoxide metabolite: 50%

Metabolism: Hepatic via CYP3A4 to active epoxide metabolite; induces hepatic enzymes to increase metabolism

Bioavailability: 85%

Half-life elimination: **Note:** Half-life is variable because of autoinduction which is usually complete 3-5 weeks after initiation of a fixed carbamazepine regimen.

Carbamazepine: Initial: 25-65 hours; Extended release: 35-40 hours; Multiple doses: Children: 8-14 hours; Adults: 12-17 hours

Epoxide metabolite: Initial: 25-43 hours

Time to peak, serum: Unpredictable:

Immediate release: Suspension: 1.5 hour; tablet: 4-5 hours

Extended release: Carbatrol®, Equetro®: 12-26 hours (single dose), 4-8 hours (multiple doses); Tegretol®-XR: 3-12 hours

Excretion: Urine 72% (1% to 3% as unchanged drug); feces (28%)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentThe extended-release capsule (Equetro®) is approved for acute manic and mixed episodes associated with bipolar I disorder. Like valproic acid and lithium, carbamazepine is considered a first-line agent. However, it is a significant inducer of hepatic enzymes. It is a heteroinducer and therefore, induces its own metabolism as well as metabolism of other drugs. Single-dose studies of carbamazepine show half-life ranges of 30-40 hours. After 3 weeks of continuous administration, the half-life decreases to ~20 hours. This reduction is caused by an increase in clearance resulting from autoinduction in metabolism. It is prudent to recheck serum carbamazepine levels after the first month of maintenance therapy. During chronic monotherapy, the half-life is ~12 hours and during polytherapy (with enzyme inducers; eg, phenytoin, phenobarbital), it is reduced to 8 hours. Maximal hepatic activation occurs within 2-4 weeks. Because of this, one has to be vigilant for drug-drug interactions. Studies have failed to document a correlation between plasma levels of carbamazepine and clinical response. However, correlation between CSF levels of carbamazepine's principle metabolite, the 10,11-epoxide, and clinical response in mania and depression have been observed. Therefore, this agent is best dosed clinically. Serum levels >12 mcg/mL do, however, correlate with toxicity. Carbamazepine is also used for a variety of other disorders such as aggressive behavior/episodic dyscontrol, eating disorders, alcohol withdrawal, anxiety disorders, behavioral disturbances in the developmentally disabled, and as an adjunctive agent to antipsychotic for the treatment of psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsSimultaneous administration of carbamazepine suspension with other liquids can precipitate the drug.

Carbamide Peroxide

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(KAR ba mide per OKS ide)

U.S. Brand NamesAuraphene® B [OTC]; Auro® [OTC]; Cankaid® [OTC]; Debrox® [OTC]; Dent's Ear Wax [OTC] [DSC]; E•R•O [OTC]; Gly-Oxide® [OTC]; Murine® Ear Wax Removal System [OTC]; Orajel® Perioseptic® Spot Treatment [OTC]; Otix® [OTC]

Pharmacologic CategoryAnti-inflammatory, Locally Applied; Otic Agent, Cerumenolytic

Use: Labeled IndicationsRelief of minor inflammation of gums, oral mucosal surfaces, and lips including canker sores and dental irritation; emulsify and disperse ear wax

Use: DentalRelief of minor inflammation of gums, oral mucosal surfaces, and lips (including canker sores and dental irritation)

Dosing: Adults

Minor inflammation of gums, oral mucosal surfaces, and lips: Topical: Oral solution (should not be used for >7 days): Apply several drops undiluted on affected area 4 times/day after meals and at bedtime; expectorate after 2-3 minutes **or** place 10 drops onto tongue, mix with saliva, swish for several minutes, expectorate

Ear wax removal: Otic: Tilt head sideways and instill 5-10 drops twice daily up to 4 days, tip of applicator should not enter ear canal; keep drops in ear for several minutes by keeping head tilted and placing cotton in ear

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Relief of minor inflammation of gums, oral mucosal surfaces, and lips: Topical: Children ≥2 years: Refer to adult dosing.

Ear wax removal: Otic:

Children <12 years: Tilt head sideways and individualize the dose according to patient size; 3 drops (range: 1-5 drops) twice daily for up to 4 days, tip of applicator should not enter ear canal. Keep drops in ear for several minutes by keeping head tilted and placing cotton in ear.

Children ≥12 years: Refer to adult dosing.

StorageProtect from excessive heat and direct sunlight.

ContraindicationsHypersensitivity to carbamide peroxide or any component of the formulation; otic preparation should not be used in patients with a perforated tympanic membrane; ear drainage, ear pain, or rash in the ear

Warnings/Precautions

Dosage form specific issues:

- Oral: With prolonged use of oral carbamide peroxide, there is a potential for overgrowth of opportunistic organisms, damage to periodontal tissues, and delayed wound healing; should not be used for longer than 7 days. Not for OTC use in children <2 years of age.
- Otic: Do not use if ear drainage or discharge, ear pain, irritation, or rash in ear. Should not be used for longer than 4 days. Not for OTC use in children <12 years of age.

Geriatric ConsiderationsAvoid contact with hearing aids.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Rash

Local: Irritation, redness

Miscellaneous: Superinfection

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid, oral: 10% (60 mL)

Cankaid®: 10% (22 mL)

Gly-Oxide®: 10% (15 mL, 60 mL)

Solution, otic [drops]: 6.5% (15 mL)

Auraphene® B, Otix®: 6.5% (15 mL)

Auro®: 6.5% (22.2 mL)

Debrox®: 6.5% (15 mL, 30 mL)

Dent's Ear Wax: 6.5% (3.7 mL) [DSC]

E•R•O: 6.5% (15 mL) [alcohol free]

Murine® Ear Wax Removal System: 6.5% (15 mL) [contains alcohol 6.3%]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Gly-Oxide)

10% (60): $8.99

Mechanism of ActionCarbamide peroxide releases hydrogen peroxide which serves as a source of nascent oxygen upon contact with catalase; deodorant action is probably due to inhibition of odor-causing bacteria; softens impacted cerumen due to its foaming action

Pharmacodynamics/KineticsOnset of action: ~24 hours

Pharmacotherapy PearlsOtic preparation should not be used for >4 days. Oral preparation should not be used for longer than 7 days.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsUrea Peroxide

International Brand NamesBlanc-Dient (AR); Ear Clear for Ear Wax Removal (NZ); Earclear (NZ)

Carbenicillin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(kar ben i SIL in)

U.S. Brand NamesGeocillin® [DSC]

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of serious urinary tract infections and prostatitis caused by susceptible gram-negative aerobic bacilli

Dosing: Adults

Prostatitis: Oral: 2 tablets every 6 hours

Urinary tract infections: Oral: 1-2 tablets every 6 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSusceptible infections: Oral: 30-50 mg/kg/day divided every 6 hours (maximum dose: 2-3 g/day)

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 12-24 hours.

Cl_{cr} <10 mL/minute: Not recommended.

Moderately dialyzable (20% to 50%)

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.

Some penicillins (eg, carbenicillin, ticarcillin and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Dietary ConsiderationsShould be taken with water on empty stomach. Sodium content of 382 mg tablet: 23 mg (1 mEq).

Compatibility Solution:

Compatible: Ampicillin, cimetidine, clindamycin, dopamine, hydrocortisone, lidocaine, potassium chloride, verapamil.

Incompatible: Aminophylline, amphotericin B, epinephrine, erythromycin, gentamicin, levarterenol, tetracycline, vitamin B and C complex.

ContraindicationsHypersensitivity to carbenicillin, penicillins, or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended. Avoid use in severe impairment (Cl_{cr} <10 mL/minute).

Geriatric ConsiderationsHas not been studied in the elderly. Adjust dose for renal function in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, carbenicillin is classified as pregnancy category B. Penicillins cross the placenta; adequate and well-controlled studies with carbenicillin have not been completed in pregnant women.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsVery small amounts of carbenicillin are excreted in breast milk. The manufacturer recommends that caution be exercised when administering carbenicillin to nursing women. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Carbenicillin in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea

1% to 10%: Gastrointestinal: Nausea, bad taste, vomiting, flatulence, glossitis

<1%: Anemia, AST increased (mild), eosinophilia, epigastric distress, furry tongue, headache, hematuria, hypersensitivity reactions, hyperthermia, hypokalemia, leukopenia, LFTs increased, neutropenia, rash, thrombocytopenia, urticaria

Drug Interactions

Aminoglycosides: Penicillins may decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. *Risk D: Consider therapy modification*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®); false-positive urine or serum proteins.

Some penicillin derivatives may accelerate the degradation of aminoglycosides. *In vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersRenal, hepatic, and hematologic function tests

Reference RangeTherapeutic: Not established; Toxic: >250 mcg/mL (SI: >660 µmol/L)

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to beginning treatment. Use caution in presence of renal or hepatic impairment. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse response. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsRenal and hepatic function, CBC, serum potassium, bleeding times. Perform culture and sensitivity testing prior to initiating therapy.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as prescribed, at equal intervals around-the-clock, with a full glass of water, and preferably on an empty stomach, 1 hour before or 2 hours after meals. Do not skip doses and take full course of treatment even if feeling better. If you have diabetes, drug may cause false test results with Clinitest® urine glucose monitoring; use of another form of glucose monitoring is preferable. May cause diarrhea (boiled milk, buttermilk, or yogurt may help - if diarrhea persists for more than 2 days, contact prescriber for approved antidiarrhea medication); or dry mouth and bitter aftertaste (frequent mouth care may help). Report respiratory difficulty; easy bruising or bleeding; rash, itching, hives; or signs of opportunistic infection (eg, sore throat, fever, chills, fatigue, thrush, vaginal discharge, diarrhea). **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet:

Geocillin®: 382 mg [contains sodium 23 mg/tablet] [DSC]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Geocillin)

382 mg (28): $88.00

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: 30% to 40%

Distribution: Distributes into bile; low concentrations attained in CSF

Protein binding: ~50%

Half-life elimination: Children: 0.8-1.8 hours; Adults: 1-1.5 hours, prolonged to 10-20 hours with renal insufficiency

Time to peak, serum: Normal renal function: 0.5-2 hours; concentrations are inadequate for treatment of systemic infections

Excretion: Urine (~80% to 99% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Unpleasant taste and glossitis. Prolonged use of penicillins may lead to development of oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusPenicillins have been reported to cause apprehension, illusions, agitation, insomnia, depersonalization, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentRare reports of leukopenia and neutropenia; use caution with clozapine and carbamazepine

Index TermsCarbenicillin Indanyl Sodium; Carindacillin

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Pronunciation(kar bay ta PEN tane & klor fen IR a meen)

U.S. Brand NamesC-Tanna 12; Tannate 12 S; Tannic-12 S; Tannic-12 [DSC]; Tannihist-12 RF [DSC]; Trionate® [DSC]; Tussi-12 S™; Tussi-12®; Tussizone-12 RF™; Tustan 12S™

Pharmacologic CategoryAntitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of cough associated with upper respiratory tract conditions, such as the common cold, bronchitis, bronchial asthma

Dosing: AdultsCough and upper respiratory symptoms: Oral (based on carbetapentane 60 mg and chlorpheniramine 5 mg per tablet): 1-2 tablets every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCough and upper respiratory symptoms: Oral (based on carbetapentane 30 mg and chlorpheniramine 4 mg per 5 mL suspension):

2-6 years: 2.5-5 mL every 12 hours

>6 years: 5-10 mL every 12 hours

Dietary ConsiderationsTussi-12 S™ contains tartrazine.
StorageStore at controlled room temperature.
ContraindicationsHypersensitivity to carbetapentane, chlorpheniramine, or any component of the formulation; use with or within 14 days of MAO inhibitors; newborns; breast-feeding
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <2 years of age.

Dosage form specific issues:

- Tartrazine: Some products may contain tartrazine.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been performed; use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsFrequency not defined.

Central nervous system: Drowsiness, excitation (children), sedation

Gastrointestinal: GI motility decreased, dry mucous membranes

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension:

C-Tanna 12: Carbetapentane tannate 30 mg and chlorpheniramine tannate 4 mg per 5 mL (480 mL) [contains benzoic acid and tartrazine; strawberry currant flavor]

Tannate 12 S: Carbetapentane tannate 30 mg and chlorpheniramine tannate 4 mg per 5 mL (120 mL, 480 mL) [contains benzoic acid]

Tannic-12 S: Carbetapentane tannate 30 mg and chlorpheniramine tannate 4 mg per 5 mL (120 mL) [contains benzoic acid; strawberry flavor]

Tannihist-12 RF: Carbetapentane tannate 30 mg and chlorpheniramine tannate 4 mg per 5 mL (120 mL, 480 mL) [strawberry-black currant flavor] [DSC]

Tussi-12 S™: Carbetapentane tannate 30 mg and chlorpheniramine tannate 4 mg per 5 mL (120 mL) [contains benzoic acid and tartrazine; strawberry-currant flavor]

Tussizone-12 RF™: Carbetapentane tannate 30 mg and chlorpheniramine tannate 4 mg per 5 mL (120 mL, 480 mL) [contains benzoic acid and tartrazine; strawberry-black currant flavor] [DSC]

Tustan 12S™: Carbetapentane tannate 30 mg and chlorpheniramine tannate 4 mg per 5 mL (120 mL, 480 mL) [contains sodium benzoate; grape flavor]

Tablet:

Tannic-12 [DSC], Trionate® [DSC], Tussi-12®, Tussizone-12 RF™: Carbetapentane tannate 60 mg and chlorpheniramine tannate 5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Suspension (Tannihist-12 RF)

4-30 mg/5 mL (90): $20.99

Tablets (Tussi-12)

5-60 mg (30): $91.35

Tablets (Tussizone-12 RF)

5-60 mg (30): $37.99

Mechanism of ActionCarbetapentane is a nonopioid cough suppressant; chlorpheniramine is an H_1-receptor antagonist

Pharmacodynamics/Kinetics

Carbetapentane: Data not available

Chlorpheniramine: See individual agents

Related Information

- Chlorpheniramine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dry mucous membranes. Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients; this may contribute to periodontal disease and oral discomfort.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; combined use with psychotropics may produce additive sedation; monitor

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors. Anticholinergic effects may be potentiated with combined psychotropic use.

Index TermsCarbetapentane Tannate and Chlorpheniramine Tannate; Chlorpheniramine and Carbetapentane

Children 6-12 years:

Gentex LQ: 5 mL every 4-6 hours

Levall™: 2.5 mL every 4-6 hours; maximum dose of phenylephrine: 30 mg/24 hours

Children ≥12 years: Refer to adult dosing.

StorageStore between 15°C and 30°C (59°F and 86°F).
ContraindicationsHypersensitivity to carbetapentane, guaifenesin, phenylephrine, or any component of the formulation; use with or within 14 days of MAO inhibitors; severe hypertension or coronary artery disease; hyperthyroidism; newborns or infants; breast-feeding
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination; the manufacturer does not recommend use in pregnant women.
LactationExcretion in milk unknown/not recommended
Adverse ReactionsFrequency not defined. Also see individual agents.

Central nervous system: Dizziness, drowsiness, excitability, headache, insomnia, nervousness, mild stimulation, restlessness, weakness

Gastrointestinal: Nausea, vomiting

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Test InteractionsPossible color interference with determination of 5-HIAA and VMA; discontinue for 48 hours prior to test
Nursing: Physical Assessment/MonitoringSee individual agents for Guaifenesin and Phenylephrine.
Patient EducationSee individual agents for Guaifenesin and Phenylephrine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid:

Carbetaplex: Carbetapentane citrate 20 mg, guaifenesin 100 mg, and phenylephrine hydrochloride 15 mg per 5 mL (480 mL) [alcohol free, sugar free, dye free; strawberry flavor]

Gentex LQ: Carbetapentane citrate 20 mg, guaifenesin 100 mg, and phenylephrine hydrochloride 10 mg per 5 mL [contains edetate disodium and benzoic acid; spearmint flavor]

Levall™: Carbetapentane citrate 15 mg, guaifenesin 100 mg, and phenylephrine hydrochloride 5 mg per 5 mL (480 mL) [alcohol free; strawberry flavor]

Phencarb GG: Carbetapentane citrate 20 mg, guaifenesin 100 mg, and phenylephrine hydrochloride 10 mg per 5 mL (480 mL) [spearmint flavor]

Solution, oral:

Extendryl® GCP: Carbetapentane citrate 15 mg, guaifenesin 100 mg, and phenylephrine hydrochloride 5 mg per 5 mL (473 mL) [alcohol free; contains propylene glycol; strawberry flavor]

Generic AvailableYes
Mechanism of Action

Carbetapentane is a centrally-acting nonopioid cough suppressant.

Guaifenesin is an expectorant.

Phenylephrine hydrochloride is a sympathomimetic agent (primarily alpha), decongestant.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Guaifenesin: No significant effects or complications reported

Phenylephrine: Tachycardia, palpitations (use vasoconstrictor with caution)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response
Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, excitability, insomnia, nervousness, CNS stimulation, or restlessness
Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors or within 14 days of MAO inhibitor
Index TermsGuaifenesin, Carbetapentane Citrate, and Phenylephrine Hydrochloride; Phenylephrine Hydrochloride, Carbetapentane Citrate, and Guaifenesin

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to carbetapentane, pyrilamine, phenylephrine, or any component of the formulation; use with or within 14 days of MAO inhibitors; breast-feeding; newborns
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Dosage form specific issues:

- Tartrazine: Some products may contain tartrazine.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination.
LactationExcretion unknown/contraindicated
Breast-Feeding ConsiderationsSpecific information is not available; however, infants may be more sensitive to the effects of antihistamines.
Adverse ReactionsFrequency not defined.

Central nervous system: Drowsiness, sedation

Gastrointestinal: Xerostomia

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension:

C-Tanna 12D: Carbetapentane tannate 30 mg, pyrilamine tannate 30 mg, and phenylephrine tannate 5 mg per 5 mL (120 mL) [contains benzoic acid and tartrazine; strawberry currant flavor]

Tannihist-12 D: Carbetapentane tannate 30 mg, pyrilamine tannate 30 mg, and phenylephrine tannate 5 mg per 5 mL (120 mL) [alcohol free; contains sugar 15% and tartrazine; strawberry black currant flavor] [DSC]

Tussi-12® DS: Carbetapentane tannate 30 mg, pyrilamine tannate 30 mg, and phenylephrine tannate 5 mg per 5 mL (120 mL) [contains benzoic acid and tartrazine; strawberry currant flavor; packaged with oral syringe]

Tablet:

C-Tanna 12D, Tussi-12® D: Carbetapentane tannate 60 mg, pyrilamine tannate 40 mg, and phenylephrine tannate 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Tussi-12D)

10-40-60 mg (100): $240.84

Mechanism of Action

Carbetapentane is a nonopioid cough suppressant

Phenylephrine hydrochloride is a sympathomimetic agent (primarily alpha), decongestant.

Pyrilamine is an H_1-receptor antagonist.

Related Information

- Phenylephrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tachycardia, palpitations (use vasoconstrictor with caution), and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusSedation is common; may cause paradoxical excitation in pediatric patients

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. Concurrent use with psychotropics may produce additive sedation and anticholinergic side effects; monitor.

Index TermsPhenylephrine Tannate, Carbetapentane Tannate, and Pyrilamine Tannate; Pyrilamine, Phenylephrine, and Carbetapentane

Special Alerts

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Pronunciation(kar bay ta PEN tane & fen il EF rin)

U.S. Brand NamesL-All 12

Pharmacologic CategoryAntitussive; Antitussive/Decongestant; Sympathomimetic

Use: Labeled IndicationsSymptomatic relief of upper respiratory tract conditions such as the common cold, bronchial asthma, and bronchitis (acute and chronic)

Dosing: Adults**Upper respiratory symptoms:** Oral: 5-10 mL every 12 hours, not to exceed 20 mL/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricUpper respiratory symptoms: Oral:

Children:

2-6 years: 2.5 mL every 12 hours, not to exceed 5 mL/24 hours

6-12 years: 5 mL every 12 hours, not to exceed 10 mL/24 hours

Children >12 years: Refer to adult dosing.

Dietary ConsiderationsL-All 12 contains phenylalanine.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to carbetapentane, and phenylephrine, or any component of the formulation; use with or within 14 days of MAO inhibitor; newborns; breast-feeding
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).

- Diabetes: Use with caution in patients with diabetes mellitus.

- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination.
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsAlso see Phenylephrine monograph. Frequency not defined.

Central nervous system: Drowsiness, sedation

Gastrointestinal: Xerostomia

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Nursing: Physical Assessment/MonitoringAssess effectiveness and adverse reactions (CNS depression, gastrointestinal upset), also see Phenylephrine monograph. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationUse exactly as directed; do not exceed recommended dosage. You may experience dizziness, anxiety, or drowsiness (use caution when driving or engaged in tasks that require alertness until response to drug is known); headache (consult prescriber for analgesic). Report changes in urinary pattern, palpitations of changes in heartbeat; persistent CNS effects (restlessness, tremors, excitability) or other adverse reactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension:

L-All 12: Carbetapentane tannate 30 mg and phenylephrine tannate 30 mg per 5 mL (120 mL) [contains sodium benzoate and phenylalanine; strawberry flavor]

Generic AvailableNo
ManufacturerMidlothian Laboratories
Mechanism of ActionCarbetapentane is a nonopioid cough suppressant; phenylephrine is a sympathomimetic agent (primarily alpha), decongestant
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Phenylephrine: Tachycardia, palpitations (use vasoconstrictor with caution), and xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause anxiety, restlessness, or sedation

Mental Health: Effects on Psychiatric TreatmentConcurrent use with MAO inhibitors is contraindicated. May cause sedation and xerostomia; concomitant use with psychotropics may produce additive effects.

Pronunciation(kar bay ta PEN tane & soo doe e FED rin)

U.S. Brand NamesPseudacarb™; Respi-Tann™

Pharmacologic CategoryAntitussive/Decongestant

Use: Labeled IndicationsRelief of cough and congestion due to the common cold, influenza, sinusitis, or bronchitis

Dosing: AdultsRelief of cough and congestion: Oral: 2 tablets or 10 mL suspension every 12 hours (maximum: 4 doses/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRelief of cough and congestion: Oral:

2-6 years: $^1/_2$ tablet or 2.5 mL suspension every 12 hours (maximum: 4 doses/24 hours)

6-12 years: 1 tablet or 5 mL suspension every 12 hours (maximum: 4 doses/24 hours)

>12 years: Refer to adult dosing.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to carbetapentane, pseudoephedrine, or any component of the formulation; use with or within 14 days of MAO inhibitors; severe hypertension or cardiovascular disease; neonates, infants; breast-feeding

Warnings/Precautions

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination product.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk. The manufacturer of this product contraindicates its use; the AAP considers it to be “compatible” with breast-feeding. Information is not available for carbetapentane.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, cardiovascular collapse with hypotension, pallor, palpitation, tachycardia

Central nervous system: Anxiety, CNS depression, convulsions, dizziness, fear, hallucinations, headache, insomnia, restlessness, tenseness

Gastrointestinal: Nausea

Genitourinary: Dysuria

Neuromuscular & skeletal: Tremor, weakness

Respiratory: Respiratory difficulty

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension: Carbetapentane tannate 25 mg and pseudoephedrine tannate 75 mg per 5 mL (480 mL)

Respi-Tann™: Carbetapentane tannate 25 mg and pseudoephedrine tannate 75 mg per 5 mL (480 mL) [dye free; contains sodium benzoate; cherry flavor]

Tablet, chewable:

Respi-Tann™: Carbetapentane tannate 25 mg and pseudoephedrine tannate 75 mg [dye free; cherry flavor]

Pseudacarb™: Carbetapentane tannate 25 mg and pseudoephedrine tannate 75 mg [dye free; grape flavor]

Generic AvailableYes: Suspension

ManufacturerKiel Laboratories; marketed by Teamm Pharmaceuticals

Mechanism of Action

Carbetapentane is a non-narcotic antitussive.

Pseudoephedrine is a sympathomimetic amine and isomer of ephedrine; acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals.

Related Information

- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, insomnia, restlessness, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment; may cause tremor which may be mistaken for EPS; may cause tachycardia; tachycardia is also common with clozapine; monitor vital signs

Index TermsCarbetapentane Tannate and Pseudoephedrine Tannate; Pseudoephedrine and Carbetapentane

Carbidopa and Levodopa

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kar bi DOE pa & lee voe DOE pa)
U.S. Brand NamesParcopa™; Sinemet®; Sinemet® CR
Canadian Brand NamesApo-Levocarb®; Apo-Levocarb® CR; Endo®-Levodopa/Carbidopa; Novo-Levocarbidopa; Nu-Levocarb; Pro-Levocarb; Sinemet®; Sinemet® CR
Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist
Use: Labeled IndicationsIdiopathic Parkinson's disease; postencephalitic parkinsonism; symptomatic parkinsonism
Use: Unlabeled/InvestigationalRestless leg syndrome
Dosing: Adults

Parkinson's disease: Oral: Initial:

Immediate release tablet:

Initial: Carbidopa 25 mg/levodopa 100 mg 3 times/day

Dosage adjustment: Alternate tablet strengths may be substituted according to individual carbidopa/levodopa requirements. Increase by 1 tablet every other day as necessary, except when using the carbidopa 25 mg/levodopa 250 mg tablets where increases should be made using $^1/_2$-1 tablet every 1-2 days. Use of more than 1 dosage strength or dosing 4 times/day may be required (maximum: 8 tablets of any strength/day or 200 mg of carbidopa and 2000 mg of levodopa)

Sustained release tablet:

Initial: Carbidopa 50 mg/levodopa 200 mg 2 times/day, at intervals not <6 hours

Dosage adjustment: May adjust every 3 days; intervals should be between 4-8 hours during the waking day (maximum: 8 tablets/day)

Restless leg syndrome (unlabeled use): Oral: Carbidopa 25 mg/levodopa 100 mg given 30-60 minutes before bedtime; may repeat dose once

Dosing: ElderlyInitial dose: 25/100 twice daily, increase as necessary. Sinemet® CR may be used as initial therapy.
Administration: OralSpace doses evenly over the waking hours. Give with meals to decrease GI upset. Sustained release product should not be crushed. Orally-disintegrating tablets do not require water; the tablet should disintegrate on the tongue's surface before swallowing.
Dietary ConsiderationsLevodopa peak serum concentrations may be decreased if taken with food. High protein diets (>2 g/kg) may decrease the efficacy of levodopa via competition with amino acids in crossing the blood-brain barrier.

Parcopa™: Contains phenylalanine 3.4 mg per 10/100 mg and 25/100 mg strengths; phenylalanine 8.4 mg in 25/250 mg strength

StorageStore at 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C to 30°C (59°F to 86°F). Protect from light and moisture.
ContraindicationsHypersensitivity to levodopa, carbidopa, or any component of the formulation; narrow-angle glaucoma; use of MAO inhibitors within prior 14 days (however, may be administered concomitantly with the manufacturer's recommended dose of an MAO inhibitor with selectivity for MAO type B); history of melanoma or undiagnosed skin lesions
Allergy Considerations

- Levodopa Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Dyskinesias: May cause or exacerbate dyskinesias.
- Impulsive control disorders: Dopamine agonists used for Parkinson’s disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.
- Orthostatic hypotension: May cause orthostatic hypotension; Parkinson's disease patients appear to have an impaired capacity to respond to a postural challenge. Use with caution in patients at risk of hypotension (such as those receiving antihypertensive drugs) or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Parkinson's patients being treated with dopaminergic agonists ordinarily require careful monitoring for signs and symptoms of postural hypotension, especially during dose escalation, and should be informed of this risk.
- Somnolence: Patients have reported falling asleep while engaging in activities of daily living; this has been reported to occur without significant warning signs. Monitor for daytime somnolence or pre-existing sleep disorder; caution with concomitant sedating medication; discontinue if significant daytime sleepiness or episodes of falling asleep occur. Patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). Use with caution in patients receiving other CNS depressants or psychoactive agents. Effects with other sedative drugs or ethanol may be potentiated.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease, including a history of myocardial infarction and arrhythmias.
- Endocrine disease: Use with caution when interpreting plasma/urine catecholamine levels; falsely-diagnosed pheochromocytoma has been rarely reported.
- Glaucoma: Use with caution in patients with glaucoma; monitor IOP carefully in patients with wide-angle glaucoma.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Peptic ulcer disease: Use with caution in patients with peptic ulcer disease.
- Psychotic disorders: Use with extreme caution in patients with psychotic disorders; observe patients closely for development of depression with concomitant suicidal tendencies.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to CNS effects of levodopa.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Dietary protein: Distribute dietary protein throughout the day to avoid fluctuations in levodopa absorption.
- Discontinuation of therapy: Dopaminergic agents have been associated with a syndrome resembling neuroleptic malignant syndrome on abrupt withdrawal or significant dosage reduction after long-term use.

Geriatric ConsiderationsThe elderly may be more sensitive to the CNS effects of levodopa.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were observed with levodopa and carbidopa in animal studies. There are case reports of levodopa crossing the placenta in humans.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Orthostatic hypotension, arrhythmia, chest pain, hypertension, syncope, palpitation, phlebitis

Central nervous system: Dizziness, anxiety, confusion, nightmares, headache, hallucinations, on-off phenomenon, decreased mental acuity, memory impairment, disorientation, delusions, euphoria, agitation, somnolence, insomnia, gait abnormalities, nervousness, ataxia, EPS, falling, psychosis, peripheral neuropathy, seizure (causal relationship not established)

Dermatologic: Rash, alopecia, malignant melanoma, hypersensitivity (angioedema, urticaria, pruritus, bullous lesions, Henoch-Schönlein purpura)

Endocrine & metabolic: Increased libido

Gastrointestinal: Anorexia, nausea, vomiting, constipation, GI bleeding, duodenal ulcer, diarrhea, dyspepsia, taste alterations, sialorrhea, heartburn

Genitourinary: Discoloration of urine, urinary frequency

Hematologic: Hemolytic anemia, agranulocytosis, thrombocytopenia, leukopenia; decreased hemoglobin and hematocrit; abnormalities in AST and ALT, LDH, bilirubin, BUN, Coombs' test

Neuromuscular & skeletal: Choreiform and involuntary movements, paresthesia, bone pain, shoulder pain, muscle cramps, weakness

Ocular: Blepharospasm, oculogyric crises (may be associated with acute dystonic reactions)

Renal: Difficult urination

Respiratory: Dyspnea, cough

Miscellaneous: Hiccups, discoloration of sweat, diaphoresis (increased)

Postmarketing and/or case reports: Reported with dopamine agonists: Impulsive/compulsive behaviors (eg, pathological gambling, hypersexuality, binge eating)

Drug Interactions

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Levodopa. Only applies to oral iron preparations. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

MAO Inhibitors: Levodopa may enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Methionine: May diminish the therapeutic effect of Levodopa. Probably only with large doses of methionine. Data was generated using 4.5gm daily. *Risk D: Consider therapy modification*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Phenytoin: May diminish the therapeutic effect of Levodopa. *Risk C: Monitor therapy*

Pyridoxine: May diminish the therapeutic effect of Levodopa. *Risk D: Consider therapy modification*

Sapropterin: May enhance the adverse/toxic effect of Levodopa. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to CNS depression).

Food: Avoid high protein diets and high intakes of vitamin B_6.

Herb/Nutraceutical: Avoid kava kava (may decrease effects). Pyridoxine in doses >10-25 mg (for levodopa alone) or higher doses >200 mg/day (for levodopa/carbidopa) may decrease efficacy.

Test InteractionsFalse-positive reaction for urinary glucose with Clinitest®; false-negative reaction using Clinistix®; false-positive urine ketones with Acetest®, Ketostix®, Labstix®

Monitoring ParametersBlood pressure, standing and sitting/supine; symptoms of parkinsonism, dyskinesias, mental status

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness and adverse reactions (including levodopa toxicity) at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not change dosage or discontinue without consulting prescriber. Do not crush sustained release form. Therapeutic effects may take several weeks or months to achieve and you may need frequent monitoring during first weeks of therapy. Take with meals if GI upset occurs, before meals if dry mouth occurs, after eating if drooling or if nausea occurs. Take at the same time each day. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake; void before taking medication. Do not use alcohol and prescription or OTC sedatives or CNS depressants without consulting prescriber. Urine or perspiration may appear darker. You may experience drowsiness, dizziness, confusion, or vision changes (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); loss of impulse control (possibly manifested as pathological gambling, libido increases, and/or binge eating); orthostatic hypotension (use caution when changing position - rising to standing from sitting or lying); increased susceptibility to heat stroke, decreased perspiration (use caution in hot weather - maintain adequate fluids and reduce exercise activity); constipation (increased exercise, fluids, fruit, or fiber may help); dry skin or nasal passages (consult prescriber for appropriate relief); or nausea, vomiting, loss of appetite, or stomach discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report unresolved constipation or vomiting; chest pain or irregular heartbeat; respiratory difficulty; acute headache or dizziness; CNS changes (hallucination, loss of memory, nervousness, etc); suicide ideation; painful or difficult urination; abdominal pain or blood in stool; increased muscle spasticity or rigidity; skin rash; or significant worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 10/100: Carbidopa 10 mg and levodopa 100 mg; 25/100: Carbidopa 25 mg and levodopa 100 mg; 25/250: Carbidopa 25 mg and levodopa 250 mg

25-250 mg (60): $82.77

Mechanism of ActionParkinson's symptoms are due to a lack of striatal dopamine; levodopa circulates in the plasma to the blood-brain-barrier (BBB), where it crosses, to be converted by striatal enzymes to dopamine; carbidopa inhibits the peripheral plasma breakdown of levodopa by inhibiting its decarboxylation, and thereby increases available levodopa at the BBB

Pharmacodynamics/Kinetics

Duration: Variable, 6-12 hours; longer with sustained release forms

See individual agents.

Related Information

- Antiparkinsonian Agents

Pharmacotherapy Pearls50-100 mg/day of carbidopa is needed to block the peripheral conversion of levodopa to dopamine. “On-off” (a clinical syndrome characterized by sudden periods of drug activity/inactivity), can be managed by giving smaller, more frequent doses of Sinemet® or adding a dopamine agonist or selegiline; when adding a new agent, doses of Sinemet® can usually be decreased. Protein in the diet should be distributed throughout the day to avoid fluctuations in levodopa absorption. Levodopa is the drug of choice when rigidity is the predominant presenting symptom.

Conversion from levodopa to carbidopa/levodopa: **Note:** Levodopa must be discontinued at least 12 hours prior to initiation of levodopa/carbidopa:

Initial dose: Levodopa portion of carbidopa/levodopa should be at least 25% of previous levodopa therapy.

Levodopa <1500 mg/day: Sinemet® or Parcopa™ (levodopa 25 mg/carbidopa 100 mg) 3-4 times/day

Levodopa ≥1500 mg/day: Sinemet® or Parcopa™ (levodopa 25 mg/carbidopa 250 mg) 3-4 times/day

Conversion from immediate release carbidopa/levodopa (Sinemet® or Parcopa™) to Sinemet® CR (50/200):

Sinemet® or Parcopa™ [total daily dose of levodopa]/Sinemet® CR:

Sinemet® or Parcopa™ (levodopa 300-400 mg/day): Sinemet® CR (50/200) 1 tablet twice daily

Sinemet® or Parcopa™ (levodopa 500-600 mg/day): Sinemet® CR (50/200) 1 1/2 tablets twice daily or 1 tablet 3 times/day

Sinemet® or Parcopa™ (levodopa 700-800 mg/day): Sinemet® CR (50/200) 4 tablets in 3 or more divided doses

Sinemet® or Parcopa™ (levodopa 900-1000 mg/day): Sinemet® CR (50/200) 5 tablets in 3 or more divided doses

Intervals between doses of Sinemet® CR should be 4-8 hours while awake; when divided doses are not equal, smaller doses should be given toward the end of the day,

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste alterations. Dopaminergic therapy in Parkinson's disease (ie, treatment with levodopa and carbidopa combination) is associated with orthostatic hypotension. Patients medicated with this drug combination should be carefully assisted from the chair and observed for signs of orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Anesthesia and Critical Care Concerns/Other ConsiderationsConsider use of alternative therapies before attempting to use levodopa containing products.

50-100 mg/day of carbidopa is needed to block the peripheral conversion of levodopa to dopamine. “On-off” (a clinical syndrome characterized by sudden periods of drug activity/inactivity), can be managed by giving smaller, more frequent doses of Sinemet® or adding a dopamine agonist or selegiline; when adding a new agent, doses of Sinemet® can usually be decreased. Protein in the diet should be distributed throughout the day to avoid fluctuations in levodopa absorption. Levodopa is the drug of choice when rigidity is the predominant presenting symptom.

Medication Safety Issues

International issues:

Lodosyn® may be confused with Lidosen® which is a brand name for lidocaine in Italy

Pronunciation(kar bi DOE pa)
U.S. Brand NamesLodosyn®
Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist
Use: Labeled IndicationsGiven with levodopa in the treatment of parkinsonism to enable a lower dosage of levodopa to be used and a more rapid response to be obtained and to decrease side effects; for details of administration and dosage, see Levodopa; has no effect without levodopa
Dosing: AdultsParkinson's disease (adjunct to levodopa): Oral: 70-100 mg/day; maximum daily dose: 200 mg
Dosing: ElderlyRefer to adult dosing.
Dietary ConsiderationsMay be taken with meals to decrease GI upset.
ContraindicationsHypersensitivity to carbidopa or levodopa, or any component of the formulation; use of nonselective MAO antagonists; narrow-angle glaucoma; history of melanoma or undiagnosed skin lesions
Warnings/Precautions

Concerns related to adverse effects:

- Dyskinesias: May occur at lower levodopa dosages than with monotherapy (levodopa dosage may need to be reduced).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease, including a history of myocardial infarction and arrhythmias.
- Endocrine disease: Use with caution in patients with endocrine disease.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Peptic ulcer disease: Use with caution in patients with peptic ulcer disease.
- Psychotic disorders: Use with extreme caution in patients with psychotic disorders; observe patients closely for development of depression with concomitant suicidal tendencies.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Other warnings/precautions:

- Antiparkinsonian activity: Has no antiparkinsonian activity when administered alone.
- Discontinuation of therapy: Dopaminergic agents have been associated with a syndrome resembling neuroleptic malignant syndrome on abrupt withdrawal or significant dosage reduction after long-term use.

Pregnancy Risk FactorC
Adverse ReactionsAdverse reactions are associated with concomitant administration with levodopa

>10%: Central nervous system: Anxiety, confusion, nervousness, mental depression

1% to 10%:

Cardiovascular: Orthostatic hypotension, palpitation, cardiac arrhythmia

Central nervous system: Memory loss, insomnia, fatigue, hallucinations, ataxia, dystonic movements

Gastrointestinal: Nausea, vomiting, GI bleeding

Ocular: Blurred vision

<1%: Hypertension, duodenal ulcer, hemolytic anemia

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Lodosyn)

25 mg (30): $30.76

Mechanism of ActionCarbidopa is a peripheral decarboxylase inhibitor with little or no pharmacological activity when given alone in usual doses. It inhibits the peripheral decarboxylation of levodopa to dopamine; and as it does not cross the blood-brain barrier, unlike levodopa, effective brain concentrations of dopamine are produced with lower doses of levodopa. At the same time, reduced peripheral formation of dopamine reduces peripheral side-effects, notably nausea and vomiting, and cardiac arrhythmias, although the dyskinesias and adverse mental effects associated with levodopa therapy tend to develop earlier.
Pharmacodynamics/Kinetics

Absorption: 40% to 70%

Distribution: Does not cross the blood-brain barrier; in rats, reported to cross placenta and be excreted in milk

Protein binding: 36%

Half-life elimination: 1-2 hours

Excretion: Urine (as unchanged drug and metabolites)

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSeasonal and perennial allergic rhinitis; vasomotor rhinitis

Dosing: AdultsNasal congestion, allergic symptoms: Oral:

Liquid (Pediatex™-D): 10 mL 4 times/day

Syrup (Hydro-Tussin™-CBX, Palgic®-DS): 10 mL 4 times/day

Tablet, timed release (Palgic®-D): 1 tablet every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricNasal congestion, allergic symptoms: Oral:

Children:

Drops (Andehist NR, Carbaxefed RF, Sildec):

1-3 months: 0.25 mL 4 times/day

3-6 months: 0.5 mL 4 times/day

6-12 months: 0.75 mL 4 times/day

12-24 months: 1 mL 4 times/day

Liquid (Pediatex™-D):

1-3 months: 1.25 mL up to 4 times/day

3-6 months: 2.5 mL up to 4 times/day

6-9 months: 3.75 mL up to 4 times/day

9-18 months: 3.75-5 mL up to 4 times/day

18 months to 6 years: 5 mL 3-4 times/day

>6 years: Refer to adult dosing.

Syrup (Hydro-Tussin™-CBX, Palgic®-DS):

1-3 months: 1.25 mL up to 4 times/day

3-6 months: 2.5 mL up to 4 times/day

6-9 months: 3.75 mL up to 4 times/day

9-18 months: 3.75-5 mL up to 4 times/day

18 months to 6 years: 5 mL 3-4 times/day

>6 years: Refer to adult dosing.

Tablet, timed release:

6-12 years (Palgic®-D): One-half tablet every 12 hours

≥12 years (Palgic®-D): Refer to adult dosing.

Administration: OralPalgic®-D: Tablets may be broken in half; do not crush or chew.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to carbinoxamine, pseudoephedrine, or any component of the formulation; severe hypertension or coronary artery disease; MAO inhibitor therapy; GI or GU obstruction; peptic ulcer disease; narrow-angle glaucoma; avoid use in premature or term infants due to a possible association with SIDS; acute asthma attack
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <1 month of age. Use with caution in atopic children.

Geriatric ConsiderationsElderly are more predisposed to adverse effects of sympathomimetics since they frequently have cardiovascular diseases and diabetes mellitus, and may be on multidrug therapy. It may be advisable to treat with a short-acting immediate-release formulation before initiating sustained-release long-acting formulations. Carbinoxamine exhibits anticholinergic action which may cause constipation, urinary retention, and mental confusion in the elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsSmall amounts of antihistamines and pseudoephedrine are excreted in breast milk. Premature infants and newborns have a higher risk of intolerance to antihistamines. Antihistamines may inhibit lactation.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, cardiovascular collapse, hypertension, pallor, tachycardia

Central nervous system: Anxiety, convulsions, CNS stimulation, dizziness, excitability (children; rare), fear, hallucinations, headache, insomnia, nervousness, restlessness, sedation

Gastrointestinal: Anorexia, diarrhea, dyspepsia, nausea, vomiting, xerostomia

Neuromuscular skeletal: Tremors, weakness

Ocular: Diplopia

Renal: Dysuria, polyuria, urinary retention (with BPH)

Respiratory: Respiratory difficulty

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agent for Pseudoephedrine.

Patient EducationSee individual agent for Pseudoephedrine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid:

Cordron-D NR: Carbinoxamine maleate 2 mg and pseudoephedrine hydrochloride 12.5 mg per 5 mL (480 mL) [cotton candy flavor] [DSC]

Pediatex™-D: Carbinoxamine maleate 2 mg and pseudoephedrine hydrochloride 20 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; cotton candy flavor] [DSC]

Solution: Carbinoxamine maleate 2 mg and pseudoephedrine hydrochloride 25 mg per 5 mL (480 mL) [DSC]

Carboxine-PSE: Carbinoxamine maleate 2 mg and pseudoephedrine hydrochloride 20 mg per 5 mL (480 mL) [peach flavor] [DSC]

Solution, oral drops:

Andehist NR: Carbinoxamine maleate 1 mg and pseudoephedrine hydrochloride 15 mg per mL (30 mL) [alcohol and sugar free; raspberry flavor] [DSC]

Carbaxefed RF: Carbinoxamine maleate 1 mg and pseudoephedrine hydrochloride 15 mg per mL (30 mL) [alcohol free; contains sodium benzoate; cherry flavor] [DSC]

Sildec: Carbinoxamine maleate 1 mg and pseudoephedrine hydrochloride 15 mg per mL (30 mL) [raspberry flavor] [DSC]

Syrup: Carbinoxamine maleate 2 mg and pseudoephedrine hydrochloride 25 mg per 5 mL (480 mL)

Hydro-Tussin™-CBX [DSC], Palgic®-DS [DSC]: Carbinoxamine maleate 2 mg and pseudoephedrine hydrochloride 25 mg per 5 mL (480 mL) [alcohol, dye, and sugar free; strawberry/pineapple flavor]

Tablet, timed release:

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Rondec-TR)

8-120 mg (30): $42.99

Mechanism of ActionCarbinoxamine competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract; pseudoephedrine, a sympathomimetic amine and isomer of ephedrine, acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals
Related Information

- Carbinoxamine
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response
Mental Health: Effects on Mental StatusDrowsiness is common; may cause fatigue, nervousness, or dizziness; may rarely produce depression
Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors; concurrent use with sedating psychotropics or CNS depressants may produce additive adverse effects

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Pronunciation(kar bi NOKS a meen)

U.S. Brand NamesPalgic®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSeasonal and perennial allergic rhinitis; vasomotor rhinitis; urticaria; decrease severity of other allergic reactions

Dosing: Adults

Allergic rhinitis/urticaria: Oral (Palgic®): 4-8 mg 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Allergic rhinitis/urticaria:** Oral (Palgic®): Children:

>3-6 years: 2-5 mg 3-4 times/day

>6 years: 4-6 mg 3-4 times/day

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to carbinoxamine or any component of the formulation; use with or within 14 days of MAO inhibitor therapy; children <2 years of age; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <2 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsIt is not known if carbinoxamine is found in breast milk; prolonged or large doses may cause drowsiness in breast-feeding infants. Use while breast-feeding is contraindicated by the manufacturer.

Adverse ReactionsFrequency not defined.

Cardiovascular: Extrasystoles, hypotension, palpitation, tachycardia

Central nervous system: Chills, confusion, coordination impaired (most frequent), dizziness (most frequent), euphoria, excitability (children), fatigue, headache, insomnia, irritability, nervousness, neuritis, restlessness, sedation (most frequent), seizure, sleepiness (most frequent), vertigo

Dermatologic: Photosensitivity, rash, urticaria

Endocrine & metabolic: Early menses

Gastrointestinal: Anorexia, constipation, diarrhea, epigastric distress (most frequent), heartburn, nausea, vomiting, xerostomia

Genitourinary: Difficult urination, urinary frequency, urinary retention

Hematologic: Agranulocytosis, hemolytic anemia, thrombocytopenia

Neuromuscular & skeletal: Paresthesia, tremor, weakness

Ocular: Blurred vision, diplopia

Otic: Labyrinthitis, tinnitus

Renal: Polyuria

Respiratory: Bronchial secretions thickening (most frequent), chest tightness, nasal congestion, nasopharyngeal dryness, wheezing

Miscellaneous: Hypersensitivity reactions (including anaphylactic shock), diaphoresis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, as maleate:

Palgic®: 4 mg/5 mL (480 mL) [bubble gum flavor]

Tablet, as maleate [scored]:

Palgic®: 4 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Palgic)

4 mg (60): $57.76

Mechanism of ActionCarbinoxamine competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract.

Pharmacodynamics/KineticsHalf-life elimination: 10-20 hours

Pharmacotherapy PearlsCarbinoxamine maleate is ~71% carbinoxamine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, nervousness, or sedation; may cause excitability in children

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment; concurrent use with psychotropics may produce additive sedation

Index TermsCarbinoxamine Maleate

CARBOplatin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

CARBOplatin may be confused with CISplatin, oxaliplatin

Paraplatin® may be confused with Platinol®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(KAR boe pla tin)

Canadian Brand NamesParaplatin-AQ

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent; Antineoplastic Agent, Platinum Analog

Use: Labeled IndicationsTreatment of ovarian cancer

Use: Unlabeled/InvestigationalLung cancer, head and neck cancer, endometrial cancer, esophageal cancer, bladder cancer, breast cancer, cervical cancer, CNS tumors, germ cell tumors, osteogenic sarcoma, and high-dose therapy with stem cell/bone marrow support

Dosing: AdultsRefer to individual protocols: **Note:** Doses are usually determined by the AUC using the Calvert formula.

IVPB, I.V. infusion:

Ovarian cancer: 300-360 mg/m^2 every 4 weeks

Autologous BMT (unlabeled use): 1600 mg/m^2 (total dose) divided over 4 days

In adults, dosing is commonly calculated using the Calvert formula:

Total dose (mg) = Target AUC x (GFR + 25)

Usual target AUCs:

Previously untreated patients: 6-8

Previously treated patients: 4-6

Intraperitoneal (unlabeled use): 200-650 mg/m^2 in 2 L of dialysis fluid have been administered into the peritoneum of ovarian cancer patients or target AUC: 5-7

Dosing: ElderlyThe Calvert formula should be used to calculate dosing for elderly patients.

Dosing: PediatricRefer to individual protocols:

IVPB, I.V. infusion:

Solid tumor (unlabeled use): 300-600 mg/m^2 once every 4 weeks

Brain tumor (unlabeled use): 175 mg/m^2 weekly for 4 weeks every 6 weeks, with a 2-week recovery period between courses

Dosing: Renal Impairment**Note:** Dose determination with Calvert formula uses GFR and, therefore, inherently adjusts for renal dysfunction.

The FDA-approved labeling recommends the following dosage adjustment guidelines:

Baseline Cl_{cr} 41-59 mL/minute: Initiate at 250 mg/m^2 and adjust subsequent doses based on bone marrow toxicity

Baseline Cl_{cr} 16-40 mL/minute: Initiate at 200 mg/m^2 and adjust subsequent doses based on bone marrow toxicity

Baseline Cl_{cr} ≤15 mL/minute: No guidelines are available.

The following dosage adjustments have been used by some clinicians (Aronoff, 2007): Adults (for dosing based on mg/m^2):

Hemodialysis: Administer 50% of dose

Continuous ambulatory peritoneal dialysis (CAPD): Administer 25% of dose

Continuous renal replacement therapy (CRRT): 200 mg/m^2

Dosing: Hepatic ImpairmentMinimal hepatic metabolism; dosage adjustment may not be needed. No specific dosage adjustment guidelines are available.

Dosing: Adjustment for ToxicityPlatelets <50,000 cells/mm^3 or ANC <500 cells/mm^3: Administer 75% of dose

Dosing: Combination Regimens

Adenocarcinoma, unknown primary:

- Carbo-Tax (Adenocarcinoma)
- Paclitaxel-Carboplatin-Etoposide
- PCE

Bladder cancer:

- Gemcitabine-Carboplatin (Bladder Cancer)
- Paclitaxel-Carboplatin (Bladder Cancer)
- Paclitaxel-Carboplatin-Gemcitabine

Breast cancer:

Retinoblastoma: CE (Retinoblastoma)

Rhabdomyosarcoma: CEV

Sarcoma, soft tissue:

ICE (Sarcoma)

ICE-T

Oncology: Bone Marrow - High DoseI.V.: 1.2-2.4 g/m^2 administered as 3-4 divided doses every 24-48 hours; generally infused over at least 60 minutes; 400 mg/m^2 has been infused over 15-30 minutes; generally combined with other high-dose chemotherapeutic drugs.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Calvert Formula

Administration: I.V.Infuse over 15 minutes to 24 hours. May also be administered intraperitoneally. When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before platinum derivatives to limit myelosuppression and to enhance efficacy.

Administration: I.V. DetailObserve serum creatinine. Carboplatin is nephrotoxic and drug accumulation occurs with decreased creatinine clearance.

pH: 5-7

StorageStore intact vials at room temperature of 15°C to 30°C (59°F to 86°F); protect from light. Further dilution to a concentration as low as 0.5 mg/mL is stable at room temperature (25°C) for 8 hours in NS; stable at room temperature or under refrigeration for at least 9 days in D_5W, although the manufacturer states to use within 8 hours due to lack of preservative.

Powder for reconstitution: Reconstituted to a final concentration of 10 mg/mL is stable for 5 days at room temperature (25°C).

Solution for injection: Multidose vials are stable for up to 14 days after opening when stored at room temperature.

ReconstitutionReconstitute powder to yield a final concentration of 10 mg/mL. Reconstituted carboplatin 10 mg/mL should be further diluted to a final concentration of 0.5-2 mg/mL with D_5W or NS for administration.

CompatibilityStable in $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, NS.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, cefepime, cladribine, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gatifloxacin, gemcitabine, granisetron, linezolid, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, propofol, sargramostim, teniposide, thiotepa, topotecan, vinorelbine. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Compatibility when admixed: Compatible: Cisplatin, etoposide, floxuridine, ifosfamide, ifosfamide with etoposide, paclitaxel. **Incompatible:** Fluorouracil, mesna.

ContraindicationsHistory of severe allergic reaction to cisplatin, carboplatin, other platinum-containing formulations, or any component of the formulation; pregnancy; breast-feeding

Allergy Considerations

- Platinum Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Allergic reactions: See “Concerns related to adverse effects” below.
- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Vomiting: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Allergic reactions: **[U.S. Boxed Warning]: Increased risk of allergic reactions**in patients previously exposed to platinum therapy.
- Bone marrow suppression: **[U.S. Boxed Warning]: Bone marrow suppression, which may be severe, is dose related;** reduce dosage in patients with bone marrow suppression and impaired renal function. Anemia is cumulative.
- Liver function abnormalities: High doses have resulted in severe abnormalities of liver function tests.

- Vision loss: Loss of vision (reversible) has been reported with higher than recommended doses.
- Vomiting: **[U.S. Boxed Warning]: May occur and is dose related.**

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Cisplatin: There is an increased incidence of peripheral neuropathy in patients who have previously received cisplatin.
- Taxane derivatives: When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before the platinum derivatives (carboplatin, cisplatin) to limit myelosuppression and to enhance efficacy.

Special populations:

- Elderly: There is an increased incidence of peripheral neuropathy in patients >65 years of age.
- Pediatrics: Clinically significant hearing loss has been reported to occur in pediatric patients when therapy was administered at higher than recommended doses in combination with other ototoxic agents.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Geriatric ConsiderationsPeripheral neuropathy is more frequent in patients >65 years of age.
Pregnancy Risk FactorD
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding ConsiderationsDue to the potential for toxicity in nursing infants, breast-feeding is contraindicated.
Adverse ReactionsPercentages reported with single-agent therapy.

>10%:

Central nervous system: Pain (23%)

Endocrine & metabolic: Hyponatremia (29% to 47%), hypomagnesemia (29% to 43%), hypocalcemia(22% to 31%), hypokalemia (20% to 28%)

Gastrointestinal: Vomiting (65% to 81%), abdominal pain (17%), nausea (10% to 15%)

Hematologic: Myelosuppression (dose related and dose limiting; nadir at ~21 days; recovery by ~28 days), leukopenia (85%; grades 3/4: 15% to 26%), anemia (71% to 90%; grades 3/4: 21%), neutropenia (67%; grades 3/4: 16% to 21%), thrombocytopenia (62%; grades 3/4: 25% to 35%)

Hepatic: Alkaline phosphatase increased (24% to 37%), AST increased (15% to 19%)

Neuromuscular & skeletal: Weakness (11%)

Renal: Creatinine clearance decreased (27%), BUN increased (14% to 22%)

1% to 10%:

Central nervous system: Neurotoxicity (5%)

Dermatologic: Alopecia (2% to 3%)

Gastrointestinal: Constipation (5%), diarrhea (6%), stomatitis/mucositis (1%), taste dysgeusia (1%)

Hematologic: Hemorrhagic complications (5%)

Hepatic: Bilirubin increased (5%)

Local: Pain at injection site

Neuromuscular & skeletal: Peripheral neuropathy (4% to 6%; up to 10% in older and/or previously-treated patients)

Ocular: Visual disturbance (1%)

Otic: Ototoxicity (1%)

Renal: Creatinine increased (6% to 10%)

Miscellaneous: Infection (5%), hypersensitivity (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Anaphylaxis, anorexia, bronchospasm, cardiac failure, cerebrovascular accident, embolism, erythema, fever, hemolytic uremic syndrome (HUS), hyper-/hypotension, malaise, necrosis (associated with extravasation), nephrotoxicity, neurotoxicity, pruritus, rash, secondary malignancies, urticaria, vision loss

Oncology: VesicantNo
Oncology: Emetic PotentialModerate (30% to 60%)
Oncology: Bone Marrow - Unique Toxicity

Dermatologic: Alopecia

Endocrine & metabolic: Hypokalemia, hypomagnesemia

Gastrointestinal: Nausea, vomiting, mucositis

Hepatic: Liver function tests elevated

Renal: Nephrotoxicity

Drug Interactions

Aminoglycosides: May enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Taxane Derivatives: Platinum Derivatives may enhance the myelosuppressive effect of Taxane Derivatives. Administer Taxane derivative before Platinum derivative when given as sequential infusions to limit toxicity. *Risk D: Consider therapy modification*

Topotecan: Platinum Derivatives may enhance the adverse/toxic effect of Topotecan. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersCBC (with differential and platelet count), serum electrolytes, creatinine clearance, liver function tests, BUN, creatinine

Nursing: Physical Assessment/MonitoringAssess patient allergy history prior to therapy and note specific use cautions (eg, bone marrow suppression and renal function). Assess other pharmacological or herbal products patient may be taking for potential interactions (especially products that may be ototoxic or nephrotoxic and need for sequencing with taxane derivatives). Assess results of laboratory tests (hematology, electrolytes, renal and hepatic function), prior to treatment and on a regular basis during therapy. Monitor patient response (eg, nausea and vomiting; pretreatment with antiemetic may be required), ototoxicity (audiometry may be advisable), bone marrow depression, anemia, bleeding, peripheral neuropathy frequently throughout therapy. Teach patient (or caregiver) possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, serum electrolytes, creatinine clearance, liver function, BUN, creatinine

Patient EducationDo not take any new medication during therapy unless approved by healthcare provider. This medicine can only be administered intravenously. Report immediately any redness, burning, pain, or swelling at infusion site. It is important that you maintain adequate nutrition (small, frequent meals may help) and adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea and vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help - if unresolved, consult prescriber for antiemetic); mouth sores (use soft toothbrush or cotton swabs for mouth care); or loss of hair (reversible). Report chest pain or palpitations; sore throat, fever, chills, unusual fatigue; unusual bruising/bleeding; respiratory difficulty; numbness, pain, or tingling in extremities; muscle cramps or twitching; change in hearing acuity; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Male: Do not cause a female to become pregnant. Male/female: Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution: 50 mg, 150 mg, 450 mg

Injection, solution: 10 mg/mL (5 mL, 15 mL, 45 mL, 60 mL)

Injection, solution [preservative free]: 10 mg/mL (5 mL, 15 mL, 45 mL)

Generic AvailableYes

Mechanism of ActionCarboplatin is an alkylating agent which covalently binds to DNA; possible cross-linking and interference with the function of DNA

Pharmacodynamics/Kinetics

Distribution: V_d: 16 L/kg; into liver, kidney, skin, and tumor tissue

Protein binding: 0%; platinum is 30% irreversibly bound

Metabolism: Minimally hepatic to aquated and hydroxylated compounds

Half-life elimination: Terminal: 22-40 hours; Cl_{cr} >60 mL/minute: 2.5-5.9 hours

Excretion: Urine (~60% to 90%) within 24 hours

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, mucositis, and taste dysgeusia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsObserve serum creatinine. Carboplatin is nephrotoxic and drug accumulation occurs with decreased creatinine clearance.

Index TermsCBDCA; NSC-241240

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(KAR boe prost tro METH a meen)

U.S. Brand NamesHemabate®

Canadian Brand NamesHemabate®

Pharmacologic CategoryAbortifacient; Prostaglandin

Use: Labeled IndicationsTermination of pregnancy; treatment of refractory postpartum uterine bleeding

Use: Unlabeled/InvestigationalInvestigational: Hemorrhagic cystitis

Dosing: Adults

Abortion: I.M.: 250 mcg, then 250 mcg at 1.5- to 3.5-hour intervals, depending on uterine response; a 500 mcg dose may be given if uterine response is not adequate after several 250 mcg doses; do not exceed 12 mg total dose or continuous administration for >2 days

Refractory postpartum uterine bleeding: I.M.: Initial: 250 mcg; if needed, may repeat at 15- to 90-minute intervals; maximum total dose: 2 mg (8 doses)

Hemorrhagic cystitis (unlabeled use): Bladder irrigation: [0.1-1.0 mg/dL as solution] 50 mL instilled into bladder 4 times/day for 1 hour

Dosing: ElderlyRefer to adult dosing.

Administration: I.M.Give deep I.M.; rotate site if repeat injections are required.

Administration: I.V.Do not inject I.V.; may result in bronchospasm, hypertension, vomiting, or anaphylaxis.

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F).

Bladder irrigation: Dilute immediately prior to administration in NS; stability unknown.

ReconstitutionBladder irrigation: Dilute immediately prior to administration in NS; stability unknown.

ContraindicationsHypersensitivity to carboprost tromethamine or any component of the formulation; acute pelvic inflammatory disease; active cardiac, pulmonary, renal, or hepatic dysfunction

Warnings/Precautions

Boxed warnings:

- Potent oxytocic agent: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Hypertension: Increased blood pressure may be observed with treatment.
- Pyrexia: Transient pyrexia may be observed with treatment.

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency.
- Anemia: Use with caution in patients with anemia.
- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease, especially hypotension or hypertension.
- Compromised uteri: Use with caution in patients with compromised (scarred) uterus.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Use with caution in patients with hepatic impairment, especially jaundice.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizures: Use with caution in patients with a history of seizure disorder.

Concurrent drug therapy issues:

- Antiemetic/antidiarrheals: Concomitant use of antiemetic and antidiarrheal agents is recommended to decrease incidence of GI side effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Potent oxytocic agent: **[U.S. Boxed Warning] Potent oxytocic agent; use with strict adherence to recommended dosing. Immediate intensive care and acute surgical facilities must be available.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Carboprost tromethamine is not considered feticidal, but is used to terminate pregnancy due to its ability to stimulate uterine contractions. Use is not indicated if the fetus has reached a stage of viability *in utero*. Complete abortion may not be induced in ~20% of cases.

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined. Effects due to increased smooth muscle contractility are most common.

Cardiovascular: Chest pain, flushing, hypertension, syncope, palpitation, tachycardia, tightness of chest

Central nervous system: Anxiety, chills/shivering, dizziness, drowsiness, dystonia, faintness, headache, lethargy, lightheadedness, nervousness, sleep disturbance, temperature elevation (may be drug induced or due to postabortion endometritis), vasovagal syndrome, vertigo

Dermatologic: Rash

Endocrine & metabolic: Breast tenderness, dysmenorrhea-like pain, endometritis, hot flashes, thyroid storm

Gastrointestinal: Choking sensation, diarrhea (~$^{2}/_{3}$ patients), dry throat, epigastric pain, gagging/retching, hematemesis, nausea (~$^{1}/_{3}$ patients), taste alteration, thirst, throat fullness, vomiting (~$^{2}/_{3}$ patients), xerostomia

Genitourinary: Perforated uterus, posterior cervical perforation, urinary tract infection, uterine bleeding (excessive), uterine rupture, uterine sacculation

Local: Injection site pain

Neuromuscular & skeletal: Backache, leg cramps, muscular pain, paresthesia, torticollis, weakness

Ocular: Blurred vision, eye pain, eyelid twitching

Otic: Tinnitus

Respiratory: Asthma, cough, bronchospasm, dyspnea, epistaxis, hyperventilation, pulmonary edema, respiratory distress, upper respiratory tract infection, wheezing

Miscellaneous: Diaphoresis, hiccups, retained placental fragment, septic shock

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringPremedication with an antiemetic should be considered. Monitor blood pressure, therapeutic effectiveness, and adverse reactions. Assess for complete expulsion of uterine contents (fetal tissue). Assess knowledge/instruct patient on adverse symptoms to report.

Patient EducationThis medication is used to stimulate expulsion of uterine contents (fetal tissue) or stimulate uterine contractions to reduce uterine bleeding. Report increased blood loss, acute abdominal cramping, foul-smelling vaginal discharge, or persistent elevation of temperature. Increased temperature (elevated temperature) may occur 1-16 hours after therapy and last for several hours. **Pregnancy/breast-feeding precautions:** If being treated for hemorrhagic cystitis, inform prescriber if you are pregnant. Inform prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Hemabate®: Carboprost 250 mcg and tromethamine 83 mcg per mL (1 mL) [contains benzyl alcohol]

Generic AvailableNo

Mechanism of ActionCarboprost tromethamine is a prostaglandin similar to prostaglandin F_2 alpha (dinoprost) except for the addition of a methyl group at the C-15 position. This substitution produces longer duration of activity than dinoprost; carboprost stimulates uterine contractility which usually results in expulsion of the products of conception and is used to induce abortion between 13-20 weeks of pregnancy. Hemostasis at the placentation site is achieved through the myometrial contractions produced by carboprost.

Pharmacodynamics/KineticsExcretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or nervousness; rare reports of dystonia

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCarboprost; Prostaglandin F_2

Jump To Field (Select Field Name)

Pronunciation(kar eye soe PROE dole, AS pir in, and KOE deen)

U.S. Brand NamesSoma® Compound w/Codeine [DSC]

Pharmacologic CategorySkeletal Muscle Relaxant

Use: Labeled IndicationsSkeletal muscle relaxant

Use: DentalTreatment of muscle spasms and pain associated with acute temporomandibular joint pain (TMJ)

Dosing: AdultsSkeletal muscle relaxant, analgesic: Oral: 1 or 2 tablets 4 times/day (maximum: 8 tablets/day); treatment should be temporary (2-3 weeks)

Dosing: ElderlyAvoid or use with caution in the elderly (>65 years of age); adverse effects (eg, orthostatic hypotension and CNS depression) may be potentiated.

StorageStore at controlled room temperature 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

RestrictionsC-III

ContraindicationsHypersensitivity to a carbamate (eg, meprobamate); serious gastrointestinal complications (eg, bleeding, perforations, obstruction) due to aspirin use; aspirin-induced asthma; acute intermittent porphyria

Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Gastrointestinal effects: Serious GI effects (eg, bleeding, perforation, and intestinal obstruction) may occur (possibly fatal) with aspirin use. Use with caution in patients with a history of GI bleeding from ulcers; history of poor baseline health; geriatric patients; patients taking high doses of aspirin; patients taking concurrent anticoagulants, NSAIDs, or large amounts of ethanol.
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).
- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.
- Seizures: Carisoprodol has been associated (rarely) with seizures in patients with and without seizure history.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment; not studied.
- Renal impairment: Use with caution in patients with renal impairment; not studied.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- CYP2D6 “ultra-rapid metabolizers”: Use caution in patients with two or more copies of the variant CYP2D6*2 allele; may have extensive conversion from codeine to morphine and thus increased opioid-mediated effects.

- Elderly: Avoid or use with caution in the elderly (>65 years of age); may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <16 years of age.
- Surgical patients: Aspirin should be avoided (if possible) in surgical patients for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding.

Other warnings/precautions:

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms

Pregnancy Risk FactorD
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsRefer to Codeine monograph.
Adverse ReactionsSee individual agents.
Metabolism/Transport Effects

Carisoprodol: **Substrate** of CYP2C19 (major)

Aspirin: **Substrate** of CYP2C9 (minor)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease codeine levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression). Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have additional antiplatelet activity). Limit curry powder, paprika, licorice; may cause salicylate accumulation (these foods contain 6 mg salicylate/100 g; an ordinary American diet contains 10-200 mg/day of salicylate).

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness is common; may produce depression or paradoxical CNS stimulation
Mental Health: Effects on Psychiatric TreatmentRarely may cause leukopenia or aplastic anemia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation
Index TermsAspirin, Carisoprodol, and Codeine; Codeine, Aspirin, and Carisoprodol

Carisoprodol and Aspirin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kar eye soe PROE dole & AS pir in)

U.S. Brand NamesSoma® Compound

Pharmacologic CategorySkeletal Muscle Relaxant

Use: Labeled IndicationsSkeletal muscle relaxant

Use: DentalTreatment of muscle spasms and pain associated with acute temporomandibular joint pain (TMJ)

Dosing: AdultsSkeletal muscle relaxant (including TMJ pain/spasm): Oral: 1 or 2 tablets 4 times/day

Dosing: ElderlyAvoid use in the elderly due to risk of orthostatic hypotension and CNS depression.

Allergy Considerations

- Salicylate Allergy/Sensitivity

Pregnancy Risk FactorC/D (full-dose aspirin in 3rd trimester)

LactationEnters breast milk/contraindicated

Metabolism/Transport Effects

Carisoprodol: **Substrate** of CYP2C19 (major)

Aspirin: **Substrate** of CYP2C9 (minor)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Carisoprodol 200 mg and aspirin 325 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Carisoprodol-Aspirin)

200-325 mg (30): $15.99

Tablets (Soma Compound)

200-325 mg (30): $137.54

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Aspirin
- Carisoprodol

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Carisoprodol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kar eye soe PROE dole)
U.S. Brand NamesSoma®
Canadian Brand NamesSoma®
Pharmacologic CategorySkeletal Muscle Relaxant
Use: Labeled IndicationsShort-term (2-3 weeks) relief of skeletal muscle pain
Use: DentalTreatment of muscle spasms and pain associated with acute temporomandibular joint (TMJ) pain
Dosing: Adults**Note:** Carisoprodol should only be used for short periods (2-3 weeks) due to lack of evidence of effectiveness with prolonged use.

Treatment of muscle spasms and pain associated with acute TMJ pain: Oral: 250-350 mg 3 times/day and at bedtime

Dosing: ElderlyNot recommended for use in the elderly (see Geriatric Considerations).
Dosing: Pediatric

Children ≥16 years: Refer to adult dosing.

Administration: OralAdminister with or without food.
Dietary ConsiderationsMay give with or without food.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to carisoprodol, meprobamate, or any component of the formulation; acute intermittent porphyria
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Idiosyncratic reactions: May occur following the initial dose and may include severe weakness, transient quadriplegia, euphoria, or vision loss (temporary).

- Seizures: Has been associated (rarely) with seizures in patients with and without seizure history.

Disease-related concerns:

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use. Limit use to 2-3 weeks. Withdrawal symptoms have been reported after abrupt cessation of prolonged use.

- Hepatic impairment: Safety has not been established in patients with hepatic impairment; use caution.

- Renal impairment: Safety has not been established in patients with renal impairment; use caution.

Concurrent drug therapy issues:

- Poor metabolizers: Carisoprodol should be used with caution in patients with reduced functional alleles of CYP2C19; poor metabolizers have been shown to have a fourfold increase in exposure to carisoprodol and a 50% reduced exposure to the metabolite meprobamate compared to normal metabolizers.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Geriatric ConsiderationsAvoid or use with caution in the elderly; not considered a drug of choice because of the risk of orthostatic hypotension and CNS depression; no data available on the use of skeletal muscle relaxants in the geriatric population.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal data suggests that carisoprodol crosses placenta and adverse events have been observed in animal studies. Limited postmarketing data with meprobamate (the active metabolite) demonstrate a possible risk for congenital malformations. Use only if benefit outweighs the risk.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsCarisoprodol levels in breast milk may be 2-4 times that of maternal plasma levels. The estimated dose to the infant was reported as 6.9% of the weight adjusted maternal dose in one case report and ~4% of the weight-adjusted maternal dose in another. In both cases, breast milk production was decreased requiring supplemental formula or cessation of breast-feeding. Other than slight sedation reported in one infant, no symptoms of withdrawal or other adverse events were noted in these 2 cases. Effects on long-term development are not known.

Adverse Reactions

>10%: Central nervous system: Drowsiness (13% to 17%)

1% to 10%: Central nervous system: Dizziness (7% to 8%), headache (3% to 5%)

Postmarketing and/or case reports: Agitation, anaphylaxis, angioedema, asthma exacerbation, ataxia, burning eyes, depression, dermatitis (allergic), dyspnea, epigastric pain, eosinophilia, erythema multiforme, fixed drug eruption, flushing of face, headache, hiccups, hypersensitivity reactions, hypotension (postural), idiosyncratic reaction (symptoms may include agitation, ataxia, confusion, diplopia, disorientation, dysarthria, euphoria, extreme weakness, mydriasis, temporary vision loss, and/or transient quadriplegia); insomnia, irritability, leukopenia, nausea, pancytopenia, paradoxical CNS stimulation, pruritus, rash, seizure, syncope, tachycardia, tremor, urticaria, vertigo, vomiting, weakness, withdrawal syndrome (abdominal cramps, headache, insomnia, nausea, seizure)

Metabolism/Transport Effects

Substrate of CYP2C19 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Monitoring Parameters

Look for relief of pain and/or muscle spasm and avoid excessive drowsiness; signs of drug abuse in addiction-prone individuals

Nursing: Physical Assessment/Monitoring

Assess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy (according to rationale for therapy) and adverse reactions. Monitor for excessive drowsiness at beginning of therapy and periodically with long-term use. Do not discontinue abruptly; taper dosage slowly (withdrawal symptoms may occur). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient Education

Take exactly as directed. Do not increase dose or discontinue this medication without consulting prescriber. Do not use alcohol, prescriptive or OTC antidepressants, sedatives, or pain medications without consulting prescriber. You may experience drowsiness, dizziness, lightheadedness (avoid driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or cramping (small frequent meals, frequent mouth care, or sucking hard candy may help); headache; or postural hypotension (change position slowly when rising from sitting or lying or when climbing stairs). Report excessive drowsiness or mental agitation; palpitations, rapid heartbeat, chest pain; skin rash; muscle cramping or tremors; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 350 mg

Soma®: 250 mg, 350 mg

Generic Available

Yes

Pricing: U.S. (www.drugstore.com)

Tablets (Carisoprodol)

350 mg (30): $13.99

Tablets (Soma)

250 mg (100): $268.78

350 mg (30): $159.59

Mechanism of Action

Precise mechanism is not yet clear, but many effects have been ascribed to its central depressant actions. In animals, carisoprodol blocks interneuronal activity and depresses polysynaptic neuron transmission in the spinal cord and reticular formation of the brain. It is also metabolized to meprobamate, which has anxiolytic and sedative effects.

Pharmacodynamics/Kinetics

Onset of action: ~30 minutes

Duration: 4-6 hours

Metabolism: Hepatic, via CYP2C19 to active metabolite (meprobamate)

Half-life elimination: 2.4 hours; Meprobamate: 10 hours

Time to peak, plasma: 1.5-2 hours

Excretion: Urine, as metabolite

Dental Health: Effects on Dental Treatment

No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

No information available to require special precautions

Mental Health: Effects on Mental Status

Drowsiness is common; may produce depression or paradoxical CNS stimulation

Mental Health: Effects on Psychiatric Treatment

Rarely may cause leukopenia or aplastic anemia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

Index Terms

Carisoprodate; Isobamate

Carmustine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Carmustine may be confused with bendamustine, lomustine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(kar MUS teen)

U.S. Brand NamesBiCNU®; Gliadel®

Canadian Brand NamesBiCNU®; Gliadel Wafer®

Pharmacologic CategoryAntineoplastic Agent; Antineoplastic Agent, Alkylating Agent (Nitrosourea); Antineoplastic Agent, DNA Adduct-Forming Agent; Antineoplastic Agent, DNA Binding Agent

Use: Labeled Indications

Injection: Treatment of brain tumors (glioblastoma, brainstem glioma, medulloblastoma, astrocytoma, ependymoma, and metastatic brain tumors), multiple myeloma, Hodgkin's disease (relapsed or refractory), non-Hodgkin's lymphomas (relapsed or refractory)

Wafer (implant): Adjunct to surgery in patients with recurrent glioblastoma multiforme; adjunct to surgery and radiation in patients with high-grade malignant glioma

Use: Unlabeled/InvestigationalMelanoma

Dosing: AdultsRefer to individual protocols.

Usual dosage (per manufacturer labeling): I.V.: 150-200 mg/m^2 every 6 weeks **or** 75-100 mg/m^2/day for 2 days every 6 weeks

Alternative regimens (unlabeled):

75-120 mg/m^2 days 1 and 2 every 6-8 weeks **or**

50-80 mg/m^2 days 1,2,3 every 6-8 weeks

Primary brain cancer: I.V.:

150-200 mg/m^2 every 6-8 weeks as a single dose **or**

75-120 mg/m^2 days 1 and 2 every 6-8 weeks **or**

20-65 mg/m^2 every 4-6 weeks **or**

0.5-1 mg/kg every 4-6 weeks **or**

40-80 mg/m^2/day for 3 days every 6-8 weeks

Autologous BMT: I.V.: ALL OF THE FOLLOWING DOSES ARE FATAL WITHOUT BMT

Combination therapy: Up to 300-900 mg/m^2

Single-agent therapy: Up to 1200 mg/m^2 (fatal necrosis is associated with doses >2 g/m^2)

Glioblastoma multiforme (recurrent), malignant glioma: Implantation (wafer): Up to 8 wafers may be placed in the resection cavity (total dose 62.6 mg); should the size and shape not accommodate 8 wafers, the maximum number of wafers allowed should be placed

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols: Children (unlabeled use): I.V.: 200-250 mg/m^2 every 4-6 weeks as a single dose

Dosing: Renal ImpairmentI.V.: The FDA-approved labeling does not contain renal dosing adjustment guidelines. The following dosage adjustments have been used by some clinicians (Kintzel, 1995):

Cl_{cr} 46-60 mL/minute: Administer 80% of dose

Cl_{cr} 31-45 mL/minute: Administer 75% of dose

Cl_{cr} ≤30 mL/minute: Consider use of alternative drug.

Dosing: Hepatic ImpairmentDosage adjustment may be necessary; however, no specific guidelines are available.
Dosing: Combination Regimens

Lymphoma, Hodgkin's disease: mini-BEAM

Melanoma:

Cisplatin-Dacarbazine-Carmustine (Melanoma)

Dartmouth Regimen

Multiple myeloma:

M-2

VBAP

VBMCP

Oncology: Bone Marrow - High DoseI.V.: 300-800 mg/m^2 infused over at least 2 hours; may be divided into two doses administered every 12 hours; generally combined with other high-dose chemotherapeutic drugs. **(High-dose carmustine is fatal if not followed by bone marrow or peripheral stem cell infusions.)**
Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Irritant (alcohol-based diluent). Injection: Significant absorption to PVC containers - should be administered in either glass or polyolefin containers. I.V. infusion over 1-2 hours is recommended; infusion through a free-flowing saline or dextrose infusion, or administration through a central catheter can alleviate venous pain/irritation.

High-dose carmustine: Maximum rate of infusion of ≤3 mg/m^2/minute to avoid excessive flushing, agitation, and hypotension; infusions should run over at least 2 hours; some investigational protocols dictate shorter infusions. **(High-dose carmustine is fatal if not followed by bone marrow or peripheral stem cell infusions.)**

Administration: I.V. Detail
Extravasation management: Elevate extremity. Inject long-acting dexamethasone (Decadron® LA) or by hyaluronidase throughout tissue with a 25- to 37-gauge needle. Apply warm, moist compresses.

BMT only: Vital signs must be monitored frequently during the infusion of high-dose carmustine.

BMT only: Patients receiving high-dose carmustine must be supine and may require the Trendelenburg position, fluid support, and vasopressor support.

Infusion-related cardiovascular effects are primarily due to concomitant ethanol and acetaldehyde. Use with great caution in patients with aldehyde dehydrogenase-2 deficiency or history of “alcohol flushing syndrome”. Acute lung injury tends to occur 1-3 months following carmustine infusion. Patients must be counseled to contact their BMT physician for dyspnea, cough, or fever following carmustine. Acute lung injury is managed with a course of corticosteroids.

pH: 5.6-6.0

Administration: Other

Implant: Use appropriate precautions for handling and disposal; double glove before handling; outer gloves should be discarded as chemotherapy waste after handling wafers. Any wafer or remnant that is removed upon repeat surgery should be discarded as chemotherapy waste. The outer surface of the external foil pouch is not sterile. Open pouch gently; avoid pressure on the wafers to prevent breakage. Wafer that are broken in half may be used, however, wafers broken into more than 2 pieces should be discarded. Oxidized regenerated cellulose (Surgicel®) may be placed over the wafer to secure; irrigate cavity prior to closure.

Storage

Injection: Store intact vials under refrigeration at 2°C to 8°C (36°F to 46°F); vials are stable for 36 days at room temperature. Reconstituted solutions are stable for 8 hours at room temperature (25°C) and 24 hours under refrigeration (2°C to 8°C) and protected from light. Further dilution in D_5W or NS is stable for 8 hours at room temperature (25°C) and 48 hours under refrigeration (4°C) in glass or polyolefin containers and protected from light.

Wafer: Store at or below -20°C (-4°F). Unopened foil pouches may be kept at room temperature for up to 6 hours.

ReconstitutionInjection: Initially, dilute with 3 mL of absolute alcohol. Further dilute with SWFI (27 mL) to a concentration of 3.3 mg/mL; protect from light; may further dilute with D_5W or NS, using a non-PVC container.
CompatibilityCompatible with D_5W, NS, SWFI, dacarbazine.

Y-site administration: Compatible: Amifostine, aztreonam, cefepime, filgrastim, fludarabine, gemcitabine, granisetron, ondansetron, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Allopurinol, sodium bicarbonate.

Compatibility when admixed: Incompatible with sodium bicarbonate.

ContraindicationsHypersensitivity to carmustine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Pulmonary toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Bone marrow suppression (thrombocytopenia, leukopenia) is the major toxicity and may be delayed;** monitor blood counts weekly for at least 6 weeks after administration. Myelosuppression is cumulative; consider nadir blood counts from prior dose for dosage adjustment. May cause bleeding (due to thrombocytopenia) or infections (due to neutropenia); monitor closely. Administer with caution to patients with depressed platelet, leukocyte, or erythrocyte counts; renal or hepatic impairment.
- Pulmonary toxicity: **[U.S. Boxed Warnings]: Dose-related pulmonary toxicity may occur; patients receiving cumulative doses >1400 mg/m^2 are at higher risk. Delayed onset of pulmonary fibrosis has occurred up to 17 years after treatment in children (1-16 years) who received carmustine in cumulative doses ranging from 770-1800 mg/m^2 combined with cranial radiotherapy for intracranial tumors.** Baseline pulmonary function tests are recommended.
- Secondary malignancies: Long-term use may be associated with the development of secondary malignancies.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Injection: Diluent contains significant amounts of ethanol; use caution with aldehyde dehydrogenase-2 deficiency or history of “alcohol-flushing syndrome.”

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenicity and embryotoxicity have been demonstrated in animal studies. Carmustine can cause fetal harm if administered to a pregnant woman. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant while on treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding should be discontinued.

Adverse Reactions

>10%:

Cardiovascular: Hypotension (with high-dose I.V. therapy, due to the alcohol content of the diluent)

Central nervous system: Ataxia, dizziness

Postoperatively: Seizure (wafer 5% to 54%), brain edema (wafer 4% to 23%)

Dermatologic: Burning (with skin contact), hyperpigmentation of skin (with skin contact)

Gastrointestinal: Severe nausea and vomiting, usually begins within 2-4 hours of drug administration and lasts for 4-6 hours; dose related. Patients should receive a prophylactic antiemetic regimen.

Hematologic: Myelosuppression (cumulative, dose related, delayed, and dose limiting), thrombocytopenia (onset: 28 days; recovery: 35-42 days), leukopenia (onset: 35-42 days; recovery: 42-56 days)

Hepatic: Reversible increases in bilirubin, alkaline phosphatase, and AST occur in 20% to 25% of patients

Local: Pain and burning at injection site, phlebitis

Neuromuscular & skeletal: Weakness (wafer 22%)

Ocular: Ocular toxicities (transient conjunctival flushing and blurred vision), retinal hemorrhages

Respiratory: Interstitial fibrosis occurs in up to 50% of patients receiving a cumulative dose >1400 mg/m^2, or bone marrow transplantation doses; may be delayed up to 3 years; rare in patients receiving lower doses. A history of lung disease or concomitant bleomycin therapy may increase the risk of this reaction. Patients with forced vital capacity (FVC) or carbon monoxide diffusing capacity of the lungs (DLCO) <70% of predicted are at higher risk.

Miscellaneous: Disease progression/performance deterioration (wafer 82%)

1% to 10%:

Cardiovascular: Chest pain, deep thrombophlebitis (wafer), facial edema (wafer), peripheral edema (wafer)

Central nervous system: Wafer: Amnesia, anxiety, aphasia, ataxia, brain abscess, confusion, convulsion, CSF leaks, depression, diplopia, dizziness, facial paralysis, headache, hemiplegia, hydrocephalus, hypoesthesia, insomnia, intracranial hypertension, meningitis, somnolence, speech disorder, stupor

Dermatologic: Facial flushing, probably due to the alcohol diluent; alopecia, rash (wafer), wound healing abnormal (wafer)

Gastrointestinal: Abdominal pain, anorexia, constipation, diarrhea, stomatitis

Hematologic: Anemia, hemorrhage (wafer)

Local: Abscess (wafer)

Neuromuscular & skeletal: Back pain

<1%: Allergic reaction, azotemia (progressive), cerebral hemorrhage infarction (wafer), cyst formation (wafer), dermatitis, hepatic coma, hyperpigmentation, hypotension, kidney size decreased, neuroretinitis, painless jaundice, renal failure, subacute hepatitis, tachycardia, thrombosis

Oncology: VesicantNo; the alcohol-based diluent may be an irritant, especially with high doses.
Oncology: Emetic PotentialVery high (>90%)
Oncology: Bone Marrow - Unique Toxicity

Cardiovascular: Hypotension (infusion related), arrhythmias (infusion related)

Central nervous system: Encephalopathy, ethanol intoxication, seizures, fever

Endocrine & metabolic: Hyperprolactinemia and hypothyroidism in patients with brain tumors treated with radiation

Gastrointestinal: Severe nausea and vomiting

Hepatic Hepatitis, hepatic veno-occlusive disease

Pulmonary: Dyspnea

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Carmustine. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Diluent for infusion contains ethanol; avoid concurrent use of medications that inhibit aldehyde dehydrogenase-2 or cause disulfiram-like reactions.
Monitoring ParametersCBC with differential and platelet count, pulmonary function, liver function, and renal function tests; monitor blood pressure during administration

Wafer: Complications of craniotomy (seizures, intracranial infection, brain edema)

Nursing: Physical Assessment/MonitoringShould only be administered under the supervision of an experienced cancer chemotherapy physician. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, medications that inhibit aldehyde dehydrogenase-2 or cause disulfiram-like reactions). Administer antiemetic prior to therapy. Infusion site should be monitored closely to prevent extravasation (see Extravasation Management). For BMT high-dose infusion: Patient must be monitored closely during and following infusion; supine, (Trandelenburg position may be necessary), fluid support, and vasopressor support should be available. Assess results of laboratory tests (eg, hematology, pulmonary, hepatic, and renal function) at baseline and periodically during therapy. Evaluate therapeutic response and adverse effects regularly during and for some time following therapy. Pulmonary function should be assessed for extended periods following high dose or BMT doses; acute lung injury can occur 1-3 months after treatment and pulmonary fibrosis may be delayed up to 3 years. Teach patient or caregiver possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential, platelet count, pulmonary function, liver and renal function
Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. This medication is usually administered by I.V. Report immediately any pain, burning, or swelling at infusion site; sudden onset chest pain; or difficulty breathing or swallowing. Limit oral intake for 4-6 hours before therapy to reduce potential for nausea/vomiting. It is important that you maintain adequate nutrition between treatments (small, frequent meals may help) and adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be susceptible to infection (avoid crowds and exposure to infection and do not have

any vaccinations without consulting prescriber). May cause nausea, vomiting, or anorexia (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help - if nausea/vomiting are severe, request antiemetic); mouth sores (use soft toothbrush or cotton swabs for mouth care); hyperpigmentation of skin and loss of hair (reversible). Report immediately any dyspnea, cough, or fever; chest pain or palpitations; sore throat, chills, persistent or unusual fatigue; unusual bruising/bleeding; change in color of urine or stool; change in urinary pattern; change in visual acuity; seizure activity; or CNS changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant or cause a pregnancy (males) during therapy or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Implant:

Gliadel®: 7.7 mg (8s)

Injection, powder for reconstitution:

BiCNU®: 100 mg [packaged with 3 mL of absolute alcohol as diluent]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Wafer (Gliadel Wafer)

7.7 mg (8): $20998.04

Mechanism of ActionInterferes with the normal function of DNA and RNA by alkylation and cross-linking the strands of DNA and RNA, and by possible protein modification; may also inhibit enzyme processes by carbamylation of amino acids in protein

Pharmacodynamics/Kinetics

Distribution: 3.3 L/kg; readily crosses blood-brain barrier producing CSF levels equal to >50% of blood plasma levels; highly lipid soluble

Metabolism: Rapidly hepatic; forms active metabolites

Half-life elimination: Biphasic: Initial: 1.4 minutes; Secondary: 20 minutes (active metabolites: plasma half-life of 67 hours)

Excretion: Urine (~60% to 70%) within 96 hours; lungs (6% to 10% as CO_2)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsAccidental skin contact may cause transient burning and brown discoloration of the skin. Delayed onset pulmonary fibrosis occurring up to 17 years after treatment has been reported in patients who received cumulative doses >1400 mg/m^2.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsDue to risk of hypotension, patients receiving high-dose carmustine must be supine and may require the Trendelenburg position, fluid support, and vasopressor support. Vital signs must be monitored frequently during the infusion of high-dose carmustine.

Infusion-related cardiovascular effects are primarily due to concomitant ethanol and acetaldehyde. Use with great caution in patients with aldehyde dehydrogenase-2 deficiency or history of “alcohol flushing syndrome”. Avoid concurrent use of medications that inhibit aldehyde dehydrogenase-2 or cause disulfiram-like reactions. Acute lung injury tends to occur 1-3 months following carmustine infusion. Patients must be counseled to contact their BMT physician for dyspnea, cough, or fever following carmustine. Acute lung injury is managed with a course of corticosteroids.

Index TermsBCNU; bis-chloronitrosourea; Carmustinum; NSC-409962; WR-139021

Carteolol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Carteolol may be confused with carvedilol

Pronunciation(KAR tee oh lole)

Canadian Brand NamesOcupress® Ophthalmic

Pharmacologic CategoryOphthalmic Agent, Antiglaucoma

Use: Labeled IndicationsTreatment of chronic open-angle glaucoma and intraocular hypertension

Dosing: AdultsGlaucoma or intraocular hypertension: Ophthalmic: Instill 1 drop in affected eye(s) twice daily

Dosing: ElderlyRefer to adult dosing.

Administration: OtherOphthalmic: Intended for twice daily dosing. Keep eye open and do not blink for 30 seconds after instillation. Wear sunglasses to avoid photophobic discomfort. Apply gentle pressure to lacrimal sac during and immediately following instillation (1 minute).

ContraindicationsHypersensitivity to carteolol or any component of the formulation; sinus bradycardia; heart block greater than first-degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; bronchial asthma, bronchospasm, or COPD; uncompensated cardiac failure; pulmonary edema

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Ophthalmic: Systemic absorption and adverse effects may occur, including bradycardia and/or hypotension. Should not be used alone in angle-closure glaucoma (has no effect on pupillary constriction).

Geriatric ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults; adjust dose for renal function in the elderly.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Ocular: Conjunctival hyperemia

1% to 10%: Ocular: Anisocoria, corneal punctate keratitis, corneal staining, corneal sensitivity decreased, eye pain, vision disturbances

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Monitoring ParametersOphthalmic: Intraocular pressure

Nursing: Physical Assessment/MonitoringAssess effects and interactions with other medications patient may be taking. Instruct patient on appropriate instillation.

Patient EducationWash hands before instilling. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of medication. Keep eye open and do not blink for 30 seconds after instillation. Apply gentle pressure to inner corner of eye during and immediately following installation (1 minute). Do not touch tip of applicator or let tip of applicator touch eye. Temporary stinging or burning may occur. Wear sunglasses to avoid sun sensitivity or eye discomfort. Report persistent pain, burning, vision changes, swelling, itching, or worsening of condition.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as hydrochloride: 1% (5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

Generic AvailableYes

ManufacturerAbbott Laboratories (Pharmaceutical Product Division)

Pricing: U.S. (www.drugstore.com)

Solution (Carteolol HCl)

1% (5): $17.99

1% (10): $31.99

1% (15): $46.99

Tablets (Cartrol)

2.5 mg (30): $41.24

5 mg (30): $41.24

Mechanism of ActionBlocks both beta$_1$- and beta$_2$-receptors and has mild intrinsic sympathomimetic activity; reduces intraocular pressure by decreasing aqueous humor production

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue, insomnia, confusion, and nightmares and clinically look like a major depression

Mental Health: Effects on Psychiatric TreatmentAntipsychotics and MAO inhibitors may increase the effects of beta-blockers; conversely beta-blockers may increase the effects of antipsychotics and benzodiazepines

Index TermsCarteolol Hydrochloride

Carvedilol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Carvedilol may be confused with atenolol, captopril, carbidopa, carteolol

Coreg® may be confused with Corgard®, Cortef®, Cozaar®

International issues:

Talliton® [Hungary] may be confused with Talacen® which is a brand name for pentazocine/acetaminophen combination in the U.S.

Pronunciation(KAR ve dil ole)

U.S. Brand NamesCoreg CR®; Coreg®

Canadian Brand NamesApo-Carvedilol®; Coreg®; Novo-Carvedilol; PMS-Carvedilol; RAN™-Carvedilol; ratio-Carvedilol

Pharmacologic CategoryBeta Blocker With Alpha-Blocking Activity

Use: Labeled IndicationsMild-to-severe heart failure of ischemic or cardiomyopathic origin (usually in addition to standard therapy); left ventricular dysfunction following myocardial infarction (MI) (clinically stable with LVEF ≤40%); management of hypertension

Use: Unlabeled/InvestigationalAngina pectoris

Dosing: AdultsReduce dosage if heart rate drops to <55 beats/minute.

Hypertension: Oral:

Immediate release: 6.25 mg twice daily; if tolerated, dose should be maintained for 1-2 weeks, then increased to 12.5 mg twice daily. If necessary, dosage may be increased to a maximum of 25 mg twice daily after 1-2 weeks.

Extended release: Initial: 20 mg once daily, if tolerated, dose should be maintained for 1-2 weeks then increased to 40 mg once daily if necessary; maximum dose: 80 mg once daily

Heart failure: Oral:

Immediate release: 3.125 mg twice daily for 2 weeks; if this dose is tolerated, may increase to 6.25 mg twice daily. Double the dose every 2 weeks to the highest dose tolerated by patient. (Prior to initiating therapy, other heart failure medications should be stabilized and fluid retention minimized.)

Maximum recommended dose:

Mild-to-moderate heart failure:

<85 kg: 25 mg twice daily

>85 kg: 50 mg twice daily

Severe heart failure: 25 mg twice daily

Extended release: Initial: 10 mg once daily for 2 weeks; if the dose is tolerated, increase dose to 20 mg, 40 mg, and 80 mg over successive intervals of at least 2 weeks. Maintain on lower dose if higher dose is not tolerated.

Left ventricular dysfunction following MI: Oral: **Note:** Should be initiated only after patient is hemodynamically stable and fluid retention has been minimized.

Immediate release: Initial 3.125-6.25 mg twice daily; increase dosage incrementally (ie, from 6.25-12.5 mg twice daily) at intervals of 3-10 days, based on tolerance, to a target dose of 25 mg twice daily.

Extended release: Initial: Extended release: Initial: 10-20 mg once daily; increase dosage incrementally at intervals of 3-10 days, based on tolerance, to a target dose of 80 mg once daily.

Angina pectoris (unlabeled use): Oral: *Immediate release:* 25-50 mg twice daily

Conversion from immediate release to extended release (Coreg CR®):

Current dose immediate release tablets 3.125 mg twice daily: Convert to extended release capsules 10 mg once daily

Current dose immediate release tablets 6.25 mg twice daily: Convert to extended release capsules 20 mg once daily

Current dose immediate release tablets 12.5 mg twice daily: Convert to extended release capsules 40 mg once daily

Current dose immediate release tablets 25 mg twice daily: Convert to extended release capsules 80 mg once daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNone necessary
Dosing: Hepatic ImpairmentUse is contraindicated in severe liver dysfunction.
Administration: OralAdminister with food. Extended release capsules should not be crushed or chewed. Capsules may be opened and sprinkled on applesauce for immediate use.
Dietary ConsiderationsShould be taken with food to minimize the risk of orthostatic hypotension.
Storage

Coreg®: Store at <30°C (<86°F). Protect from moisture.

Coreg CR®: Store at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsSerious hypersensitivity to carvedilol or any component of the formulation; decompensated cardiac failure requiring intravenous inotropic therapy; bronchial asthma or related bronchospastic conditions; second- or third-degree AV block, sick sinus syndrome, and severe bradycardia (except in patients with a functioning artificial pacemaker); cardiogenic shock; severe hepatic impairment
Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

- Hypotension/syncope: Symptomatic hypotension with or without syncope may occur with carvedilol (usually within the first 30 days of therapy); close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Initiation with a low dose, gradual up-titration, and administration with food may help to decrease the occurrence of hypotension or syncope. Patients should be advised to avoid driving or other hazardous tasks during initiation of therapy due to the risk of syncope.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms (eg, sweating, anxiety, tachycardia).

- Heart failure (HF): Heart failure patients may experience a worsening of renal function (rare); risk factors include ischemic heart disease, diffuse vascular disease, underlying renal dysfunction, and systolic BP <100 mm Hg. In the severe chronic heart failure trials, patients were excluded if they had a baseline serum creatinine >2.8 mg/dL or increasing serum creatinine. Initiate cautiously and monitor for possible deterioration in patient status (eg, symptoms of HF). Worsening heart failure or fluid retention may occur during upward titration; dose reduction or temporary discontinuation may be necessary. Adjustment of other medications (ACE inhibitors and/or diuretics) may also be required.

- Hepatic impairment: Use with caution in patients with mild-to-moderate hepatic impairment; use is contraindicated in patients with severe hepatic impairment. Manufacturer recommends discontinuation of therapy if liver injury occurs (confirmed by laboratory testing).

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): May precipitate or aggravate symptoms of arterial insufficiency in patients with PVD and Raynaud’s disease; use with caution and monitor for progression of arterial obstruction.

- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Thyroid disease: May mask signs of hyperthyroidism (eg, tachycardia). If hyperthyroidism is suspected, carefully manage and monitor; abrupt withdrawal may exacerbate symptoms of hyperthyroidism or precipitate thyroid storm.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.

- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric Considerations Due to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. In U.S. trials conducted by the manufacturer, hypertension patients who were elderly (>65%) had a higher incidence of dizziness (8.8% vs 6%) than seen in younger patients. No other differences noted between young and old in these trials.

Pregnancy Risk Factor C (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy Considerations Postimplantation losses were observed in animal studies. No data available on whether carvedilol crosses the placenta. Beta-blockers have been associated with persistent bradycardia, hypotension, and IUGR; IUGR probably related to maternal hypertension. Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding.

Lactation Excretion in breast milk unknown/not recommended

Adverse Reactions **Note:** Frequency ranges include data from hypertension and heart failure trials. Higher rates of adverse reactions have generally been noted in patients with heart failure. However, the frequency of adverse effects associated with placebo is also increased in this population.

>10%:

Cardiovascular: Hypotension (9% to 20%)

Central nervous system: Dizziness (2% to 32%), fatigue (4% to 24%)

Endocrine & metabolic: Hyperglycemia (5% to 12%)

Gastrointestinal: Weight gain (10% to 12%), diarrhea (1% to 12%)

Neuromuscular & skeletal: Weakness (7% to 11%)

1% to 10%:

Cardiovascular: Bradycardia (2% to 10%), syncope (3% to 8%), peripheral edema (1% to 7%), generalized edema (5% to 6%), angina (1% to 6%), dependent edema (≤4%), AV block, cerebrovascular accident, hypertension, hyper-/hypovolemia, postural hypotension, palpitation

Central nervous system: Headache (5% to 8%), depression, fever, hypoesthesia, hypotonia, insomnia, malaise, somnolence, vertigo

Endocrine & metabolic: Hypercholesterolemia (1% to 4%), hypertriglyceridemia (1%), diabetes mellitus, gout, hyperkalemia, hyperuricemia, hypoglycemia, hyponatremia

Gastrointestinal: Nausea (2% to 9%), vomiting (1% to 6%), abdominal pain, melena, periodontitis, weight loss

Genitourinary: Impotence

Hematologic: Anemia, prothrombin decreased, purpura, thrombocytopenia

Hepatic: Alkaline phosphatase increased (1% to 3%), GGT increased, transaminases increased

Neuromuscular & skeletal: Back pain (2% to 7%), arthralgia (1% to 6%), arthritis, muscle cramps, paresthesia

Ocular: Blurred vision (1% to 5%)

Renal: BUN increased (≤6%), nonprotein nitrogen increased (6%), albuminuria, creatinine increased, glycosuria, hematuria, renal insufficiency

Respiratory: Cough (5% to 8%), nasopharyngitis (4%), rales (4%), dyspnea (>3%), pulmonary edema (>3%), rhinitis (2%), nasal congestion (1%), sinus congestion (1%)

Miscellaneous: Injury (3% to 6%), allergy, flu-like syndrome, sudden death

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Anaphylactoid reaction, alopecia, aplastic anemia (rare, all events occurred in patients receiving other medications capable of causing this effect), amnesia, asthma, bronchospasm, bundle branch block, cholestatic jaundice, concentration decreased, diaphoresis, erythema multiforme, exfoliative dermatitis, GI hemorrhage, HDL decreased, hearing decreased, hyperbilirubinemia, hypokalemia, hypokinesia, interstitial pneumonitis, leukopenia, libido decreased, migraine, myocardial ischemia, nervousness, neuralgia, nightmares, pancytopenia, paresis, peripheral ischemia, photosensitivity, pruritus, rash (erythematous, maculopapular, and psoriaform), respiratory alkalosis, seizure, Stevens-Johnson syndrome, tachycardia, tinnitus, toxic epidermal necrolysis, urinary incontinence, xerostomia

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2C9 (major), 2D6 (major), 2E1 (minor), 3A4 (minor)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Beta2-Agonists: Alpha-/Beta-Blockers may diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Carvedilol. *Risk C: Monitor therapy*

CycloSPORINE: Carvedilol may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Digoxin: Carvedilol may increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Alpha-/Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Food decreases rate but not extent of absorption. Administration with food minimizes risks of orthostatic hypotension.

Herb/Nutraceutical: Avoid herbs with hypertensive properties (bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng [American], kola, licorice); may diminish the antihypertensive effect of carvedilol. Avoid herbs with hypotensive properties (black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse); may enhance the hypotensive effect of carvedilol.

Monitoring ParametersHeart rate, blood pressure (base need for dosage increase on trough blood pressure measurements and for tolerance on standing systolic pressure 1 hour after dosing); renal studies, BUN, liver function; in patient with increase risk for developing renal dysfunction, monitor during dosage titration.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially anything that will effect blood pressure). Blood pressure and heart rate should be assessed prior to and following first doses and any change in dose. Caution patients with diabetes to monitor glucose levels closely (beta-blockers may alter glucose tolerance). Assess results of laboratory tests, therapeutic effectiveness (eg, reduction of hypertension or angina), and adverse response (eg, CHF). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsRenal studies, BUN, liver function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed. Do not alter dose or discontinue this medication without consulting prescriber. Take pulse daily, prior to taking medication; follow prescriber's instruction about holding medication. If you have diabetes, monitor serum glucose closely (drug may alter glucose tolerance or mask signs of hypoglycemia). You may experience fatigue, dizziness, or postural hypotension (use caution when changing position from lying or sitting to standing, driving, or climbing stairs until response to medication is known); decrease in tear production; alteration in sexual performance (reversible); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report unresolved swelling of extremities; respiratory difficulty or new cough; unresolved fatigue; unusual weight gain (>5 lb/week); unresolved constipation or diarrhea; or unusual muscle weakness.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Do not get pregnant while taking this medications. Consult prescriber for appropriate contraceptive use. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release; as phosphate:

Coreg CR®: 10 mg, 20 mg, 40 mg, 80 mg

Tablet: 3.125 mg, 6.25 mg, 12.5 mg, 25 mg

Coreg®: 3.125 mg, 6.25 mg, 12.5 mg, 25 mg

Generic AvailableYes: Tablet

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Coreg CR)

12.5 mg (60): $136.00

25 mg (60): $136.00

Mechanism of ActionAs a racemic mixture, carvedilol has nonselective beta-adrenoreceptor and alpha-adrenergic blocking activity. No intrinsic sympathomimetic activity has been documented. Associated effects in hypertensive patients include reduction of cardiac output, exercise- or beta-agonist-induced tachycardia, reduction of reflex orthostatic tachycardia, vasodilation, decreased peripheral vascular resistance (especially in standing position), decreased renal vascular resistance, reduced plasma renin activity, and increased levels of atrial natriuretic peptide. In CHF, associated effects include decreased pulmonary capillary wedge pressure, decreased pulmonary artery pressure, decreased heart rate, decreased systemic vascular resistance, increased stroke volume index, and decreased right arterial pressure (RAP).

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Peak antihypertensive effect: ~1-2 hours

Absorption: Rapid and extensive

Distribution: V_d: 115 L

Protein binding: >98%, primarily to albumin

Metabolism: Extensively hepatic, via CYP2C9, 2D6, 3A4, and 2C19 (2% excreted unchanged); three active metabolites (4-hydroxyphenyl metabolite is 13 times more potent than parent drug for beta-blockade); first-pass effect; plasma concentrations in the elderly and those with cirrhotic liver disease are 50% and 4-7 times higher, respectively

Bioavailability: Immediate release: 25% to 35% (due to significant first-pass metabolism); Extended release: 85% of immediate release

Half-life elimination: 7-10 hours

Time to peak, plasma: Extended release: 5 hours

Excretion: Primarily feces

Related Information

- Beta-Blockers

Pharmacotherapy PearlsFluid retention during therapy should be treated with an increase in diuretic dosage.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Postural hypotension. Periodontitis has been reported in product labeling for carvedilol; no other reports have confirmed this effect; any possible mechanism for this effect is unknown. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue, insomnia, confusion, and nightmare and clinically look like a major depression

Mental Health: Effects on Psychiatric TreatmentFluoxetine and paroxetine may increase carvedilol's (a CYP2D6 substrate) serum levels

Cardiovascular Considerations

Atrial Fibrillation: Beta-blocker therapy provides effective rate control in patients with atrial fibrillation.

Chronic Stable Angina: Beta-blockers are effective in the treatment of chronic stable angina as monotherapy or when combined with nitrates and/or calcium channel blockers. In patients with severe intractable angina requiring negative cardiac chronotropic medications, pacemaker placement has been carried out to maintain heart rate in the setting of large doses of beta-blockers and/or calcium channel blockers. Beta-blockers are ineffective in the treatment of pure vasospastic (Prinzmetal) angina.

Heart Failure: Strong evidence supports that beta-blocker therapy, without intrinsic sympathomimetic activity (ISA), should be initiated in select patients with **stable** congestive heart failure (NYHA Class II-III). Carvedilol is a nonselective beta-blocker with alpha-blocking and antioxidant properties. To date, carvedilol, sustained release metoprolol, and bisoprolol have demonstrated a beneficial effect on morbidity and mortality. It is important that beta-blocker therapy be instituted initially at very low doses with gradual and very careful titration. Because carvedilol has alpha-adrenergic blocking effects, it may lower blood pressure to a greater extent. The definitive clinical benefits of the antioxidant property are not known at this time.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists that requires the use of other drugs, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

ST-Segment Elevation Myocardial Infarction (STEMI): Beta-blockers, without intrinsic sympathomimetic activity (ISA), have been shown to decrease morbidity and mortality when initiated in the acute treatment of STEMI and continued long-term. Oral beta-blockade should be initiated promptly in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade may be considered and given promptly if the patient is experiencing concomitant hypertension or a tachyarrhythmia (Class IIa recommendation).

Unstable Angina/Non-ST-Segment Elevation MI (UA/NSTEMI): In the treatment of UA/NSTEMI, oral beta-blockade should be initiated within the first 24 hours in patients without contraindications (eg, signs of heart failure, evidence of a low output state, risk of cardiogenic shock, or other beta-blocker contraindications) (Class I recommendation). Use of intravenous beta-blockade should only be considered if the patient is experiencing concomitant hypertension upon presentation (Class IIa recommendation).

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other Considerations

Surgery: Based on available evidence, beta-blockers should be started days to weeks before elective surgery in selected patients when possible and titrated to a heart rate <65 beats per minute. Additional data suggest that long acting beta-blockers may be superior to short acting ones (Redelmeier, 2005). The ACC/AHA 2007 guidelines on perioperative cardiovascular evaluation and care for noncardiac surgery recommend beta-blockers be continued in patients undergoing surgery who are receiving beta-blockers to treat angina, symptomatic arrhythmias, hypertension, or other ACC/AHA Class I guideline indications (Class I recommendation). The guidelines also recommend that beta-blockers be given to patients undergoing vascular surgery who have myocardial ischemia demonstrated during preoperative testing (Class I recommendation).

The guidelines also state that beta-blockers are probably recommended in patients undergoing intermediate risk (eg, carotid endarterectomy, prostate surgery) or vascular surgery in whom preoperative assessment identifies coronary heart disease or high cardiac risk (Class IIa recommendation). High cardiac risk is defined as having >1 of the following clinical risk factors: History of ischemic heart disease, compensated or prior heart failure, cerebrovascular disease, diabetes mellitus, or renal insufficiency. The use of beta-blockers is uncertain in patients undergoing intermediate risk or vascular surgery with ≤1 clinical risk factor (Class IIb recommendation).

The majority of published trials suggest a benefit of perioperative beta-blocker use during noncardiac surgery especially in high-risk patients; however, more recent clinical trials have not shown a benefit to perioperative beta-blockade for noncardiac surgery (Juul. 2006; Yang, 2006).

Caspofungin

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(kas poe FUN jin)

U.S. Brand NamesCancidas®

Canadian Brand NamesCancidas®

Pharmacologic CategoryAntifungal Agent, Parenteral; Echinocandin

Use: Labeled IndicationsTreatment of invasive *Aspergillus* infections in patients who are refractory or intolerant of other therapy; treatment of candidemia and other *Candida* infections (intra-abdominal abscesses, esophageal, peritonitis, pleural space); empirical treatment for presumed fungal infections in febrile neutropenic patient

Use: DentalManagement of angular cheilitis

Dosing: Adults**Note:** Duration of caspofungin treatment should be determined by patient status and clinical response. Empiric therapy should be given until neutropenia resolves. In patients with positive cultures, treatment should continue until 14 days after last positive culture. In neutropenic patients, treatment should be given at least 7 days after both signs and symptoms of infection **and** neutropenia resolve.

Aspergillosis, invasive: Initial dose: 70 mg on day 1; subsequent dosing: 50 mg/day. If clinical response inadequate, may increase up to 70 mg/day if tolerated, but increased efficacy not demonstrated. **Note:** Duration of therapy should be a minimum of 6-12 weeks or throughout period of immunosuppression.

Candidiasis: Initial dose: 70 mg on day 1; subsequent dosing: 50 mg/day

Esophageal: 50 mg/day; **Note:** The majority of patients studied for this indication also had oropharyngeal involvement.

Empiric therapy: Initial dose: 70 mg on day 1; subsequent dosing: 50 mg/day; if clinical response inadequate, may increase up to 70 mg/day if tolerated, but increased efficacy not demonstrated

Dosage adjustment with concomitant use of an enzyme inducer:

Patients receiving rifampin: 70 mg caspofungin daily

Patients receiving carbamazepine, dexamethasone, efavirenz, nevirapine, or phenytoin (and possibly other enzyme inducers) may require an increased daily dose of caspofungin (70 mg/day).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Aspergillosis, candidiasis, empiric therapy: Children >3 months to 17 years: I.V.: Initial dose: 70 mg/m^2 on day 1, subsequent dosing: 50 mg/m^2 once daily, may increase to 70 mg/m^2 once daily if clinical response inadequate (maximum dose: 70 mg)

Dosage adjustment with concomitant use of an enzyme inducer: Patients receiving carbamazepine, dexamethasone, efavirenz, nevirapine, phenytoin, or rifampin (and possibly other enzyme inducers): Consider 70 mg/m^2 once daily (maximum: 70 mg/day)

Dosing: Renal ImpairmentNo specific dosage adjustment is required; supplemental dose is not required following dialysis.

Dosing: Hepatic Impairment

Children: Mild-to-severe hepatic insufficiency: No clinical experience

Adults:

Mild hepatic insufficiency (Child-Pugh score 5-6): No adjustment necessary

Moderate hepatic insufficiency (Child-Pugh score 7-9): 35 mg/day; initial 70 mg loading dose should still be administered in treatment of invasive infections

Severe hepatic insufficiency (Child-Pugh score >9): No clinical experience

Calculations

- Body Surface Area: Pediatrics

Administration: I.V.Infuse slowly, over 1 hour.

Administration: I.V. DetailMonitor during infusion. Isolated cases of possible histamine-related reactions have occurred during clinical trials (rash, flushing, pruritus, facial edema).

StorageStore vials at 2°C to 8°C (36°F to 46°F). Reconstituted solution may be stored at ≤25°C (≤77°F) for 1 hour prior to preparation of infusion solution. Infusion solutions may be stored at ≤25°C (≤77°F) and should be used within 24 hours; up to 48 hours if stored at 2°C to 8°C (36°F to 46°F).

ReconstitutionBring refrigerated vial to room temperature. Reconstitute vials using 0.9% sodium chloride for injection, SWFI, or bacteriostatic water for injection. Mix gently until clear solution is formed; do not use if cloudy or contains particles. Solution should be further diluted with 0.9%, 0.45%, or 0.225% sodium chloride or LR (do not exceed final concentration of 0.5 mg/mL).

CompatibilityStable in NS, $^{1}/_{2}$NS, $^{1}/_{4}$NS, LR. Do not mix with dextrose-containing solutions. Do not coadminister with other medications.

ContraindicationsHypersensitivity to caspofungin or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; increased transaminases and rare cases of liver impairment have been reported. Dosage reduction required in moderate impairment.

Concurrent drug therapy issues:

- Cyclosporine: Concurrent use of cyclosporine should be limited to patients for whom benefit outweighs risk, due to a high frequency of hepatic transaminase elevations observed during concurrent use.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 months of age.

Other warnings/precautions:

- Duration of therapy: Limited data are available concerning treatment durations longer than 4 weeks; however, treatment appears to be well tolerated.

Geriatric ConsiderationsThe number of patients >65 years of age in clinical studies was not sufficient to establish whether a difference in response may be anticipated.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Should be used during pregnancy only if potential benefit justifies the potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Hypotension (6% to 20%), peripheral edema (6% to 11%), tachycardia (4% to 11%)

Central nervous system: Fever (13% to 30%), chills (8% to 23%), headache (5% to 15%)

Dermatologic: Rash (4% to 23%)

Endocrine & metabolic: Hypokalemia (5% to 23%)

Gastrointestinal: Diarrhea (7% to 27%), vomiting (7% to 17%), nausea (4% to 15%)

Hematologic: Hemoglobin decreased (5% to 21%), hematocrit decreased (13% to 18%), WBC decreased (12%), anemia (2% to 11%)

Hepatic: Serum alkaline phosphatase increased (13% to 22%), transaminases increased (2% to 18%), bilirubin increased (5% to 13%)

Local: Phlebitis/thrombophlebitis (18%)

Renal: Serum creatinine increased (3% to 11%), urinary RBCs increased (10%)

Respiratory: Respiratory failure (11% to 20%), cough (6% to 11%), pneumonia (4% to 11%)

Miscellaneous: Infusion reactions (20% to 35%), septic shock (11%)

1% to 10%:

Cardiovascular: Hypertension (children 9% to 10%), edema (3% to 4%)

Dermatologic: Erythema (4% to 9%), pruritus (5% to 7%)

Endocrine & metabolic: Hypomagnesemia (7%), hyperglycemia (6%), hyperkalemia (3%)

Gastrointestinal: Mucosal inflammation (4% to 10%), abdominal pain (4% to 9%)

Hepatic: Albumin decreased (7%)

Local: Infection (1% to 9%, central line)

Neuromuscular & skeletal: Back pain (children up to 4%)

Renal: Nephrotoxicity (13%), blood urea nitrogen increased (4% to 9%)

> **Note:** Nephrotoxicity defined as serum creatinine ≥2x baseline value or ≥1 mg/dL in patients with serum creatinine above ULN range (patients with Cl_{cr} <30 mL/minute were excluded)

Respiratory: Dyspnea (9%), pleural effusion (9%), respiratory distress (children up to 8%), rales (7%), tachypnea (1%)

<1%, postmarketing. and/or case reports: Abdominal distention, anaphylaxis, anorexia, anxiety, appetite decrease, arrhythmia, arthralgia, atrial fibrillation, bradycardia, coagulopathy, confusion, constipation, depression, dizziness, dyspepsia, dystonia, epistaxis, erythema multiforme, fatigue, febrile neutropenia, fluid overload, flushing, hematuria, hepatic necrosis, hepatomegaly, hepatotoxicity,

hypercalcemia, hypoxia, infusion site reactions (pain/pruritus/swelling), insomnia, jaundice, liver failure, MI, pain (extremities), pancreatitis, petechiae, pulmonary edema, renal failure/insufficiency, seizure, skin exfoliation, skin lesion, somnolence, stridor, Stevens-Johnson syndrome, tachypnea, thrombocytopenia, tremor, urinary tract infection, urticaria, weakness; histamine-mediated reactions (including facial swelling, bronchospasm, sensation of warmth) have been reported

Drug Interactions

CycloSPORINE: May enhance the adverse/toxic effect of Caspofungin. Significant increases in alanine transaminase have been reported. *Risk D: Consider therapy modification*

Inducers of Drug Clearance: May decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Caspofungin. Management: Caspofungin prescribing information recommends using a dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) who are also receiving rifampin. *Risk D: Consider therapy modification*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Tacrolimus: Caspofungin may decrease the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Monitoring ParametersLiver function

Nursing: Physical Assessment/MonitoringUse caution in presence of hepatic impairment. Assess therapeutic effectiveness (according to purpose for use) and monitor closely for adverse reactions. See Administration for I.V. specifics. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsLiver function

Patient EducationThis medication can only be administered by infusion. Report immediately any pain, burning, or swelling at infusion site or any signs of allergic reaction (eg, respiratory difficulty or swallowing, back pain, chest tightness, rash, hives, swelling of lips or mouth). Report gastrointestinal upset (nausea, vomiting, abdominal pain, diarrhea); swelling of extremities; chest pain or palpations; unusual cough; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as acetate:

Cancidas®: 50 mg [contains sucrose 39 mg], 70 mg [contains sucrose 54 mg]

Generic AvailableNo

ManufacturerMerck

Mechanism of ActionInhibits synthesis of β(1,3)-D-glucan, an essential component of the cell wall of susceptible fungi. Highest activity in regions of active cell growth. Mammalian cells do not require β(1,3)-D-glucan, limiting potential toxicity.

Pharmacodynamics/Kinetics

Protein binding: ~97% to albumin

Metabolism: Slowly, via hydrolysis and *N*-acetylation as well as by spontaneous degradation, with subsequent metabolism to component amino acids. Overall metabolism is extensive.

Half-life elimination: Beta (distribution): 9-11 hours; Terminal: 40-50 hours

Excretion: Urine (41% as metabolites, 1% to 9% unchanged) and feces (35% as metabolites)

Related Information

- Antifungal Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness and insomnia

Mental Health: Effects on Psychiatric TreatmentCarbamazepine may decrease serum concentration of caspofungin

Index TermsCaspofungin Acetate

Castor Oil

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(KAS tor oyl)

Pharmacologic CategoryLaxative, Miscellaneous

Use: Labeled IndicationsPreparation for rectal or bowel examination or surgery; rarely used to relieve constipation; also applied to skin as emollient and protectant

Dosing: Adults**Bowel evacuation, constipation:** Oil: Oral: 15-60 mL as a single dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Bowel evacuation, constipation:** Oil: Oral:

Children 2-11 years: 5-15 mL as a single dose

Children ≥12 years: Refer to adult dosing.

Dietary ConsiderationsShould be taken on an empty stomach with juice or carbonated beverages.

StorageProtect from heat.

Geriatric ConsiderationsElderly are often predisposed to constipation due to disease, immobility, drugs, low residue diets, and a decreased fluid intake usually due to a decreased “thirst reflex” with age. Avoid stimulant cathartic use on a chronic basis if possible. Use osmotic, lubricant, stool softeners, and bulk agents as prophylaxis. Patients should be instructed for proper dietary fiber and fluid intake as well as regular exercise. Monitor closely for fluid/electrolyte imbalance, CNS signs of fluid/electrolyte loss, and hypotension. Strong and chronic purging may cause severe fluid and electrolyte loss which may affect mental function (CNS). Not a drug of first choice for constipation in the elderly.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Central nervous system: Dizziness

Endocrine & metabolic: Electrolyte disturbance

Gastrointestinal: Abdominal cramps, diarrhea, nausea

Genitourinary: Pelvic congestion

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Oil, oral: 100% (60 mL, 120 mL, 180 mL, 480 mL, 3840 mL)

Generic AvailableYes: Oil

Mechanism of ActionActs primarily in the small intestine; hydrolyzed to ricinoleic acid which reduces net absorption of fluid and electrolytes and stimulates peristalsis

Pharmacodynamics/KineticsOnset of action: 2-6 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Cefaclor may be confused with cephalexin

Pronunciation(SEF a klor)
U.S. Brand NamesRaniclor™
Canadian Brand NamesApo-Cefaclor®; Ceclor®; Novo-Cefaclor; Nu-Cefaclor; PMS-Cefaclor
Pharmacologic CategoryAntibiotic, Cephalosporin (Second Generation)
Use: Labeled IndicationsTreatment of susceptible bacterial infections including otitis media, lower respiratory tract infections, acute exacerbations of chronic bronchitis, pharyngitis and tonsillitis, urinary tract infections, skin and skin structure infections
Use: DentalAlternative antibiotic for treatment of orofacial infections in patients allergic to penicillins; susceptible bacteria including aerobic gram-positive bacteria and anaerobes
Dosing: AdultsTreatment of infections: Oral: Dosing range: 250-500 mg every 8 hours
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Treatment of infections: Oral: Children >1 month: Dosing range: 20-40 mg/kg/day divided every 8-12 hours; maximum dose: 1 g/day

Otitis media: Oral: 40 mg/kg/day divided every 12 hours

Pharyngitis: Oral: 20 mg/kg/day divided every 12 hours

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 50% to 100% of dose

Cl_{cr} <10 mL/minute: Administer 50% of dose

Hemodialysis: Moderately dialyzable (20% to 50%)

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.

Chewable tablet: Should be chewed before swallowing; should not be swallowed whole.

Oral suspension: Shake well before using.

Dietary ConsiderationsCapsule, chewable tablet, and suspension may be taken with or without food. Raniclor™ contains phenylalanine 2.8 mg/cefaclor 125 mg.
StorageStore at controlled room temperature. Refrigerate suspension after reconstitution. Discard after 14 days. Do not freeze.
ContraindicationsHypersensitivity to cefaclor, any component of the formulation, or other cephalosporins
Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- *H. influenzae* infections: Beta-lactamase-negative, ampicillin-resistant (BLNAR) strains of *H. influenzae* should be considered resistant to cefaclor.
- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Special populations:

- Pediatrics: Extended release tablets are not approved for use in children <16 years of age.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Geriatric ConsiderationsHas not been studied in the elderly. Adjust dose for renal function in elderly. Considered to be one of the drugs of choice in the outpatient treatment of community-acquired pneumonia in elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal reproduction studies; therefore, cefaclor is classified as pregnancy category B. It is not known if cefaclor crosses the placenta; other cephalosporins cross the placenta and are considered safe for use during pregnancy. An increased risk of teratogenic effects has not been observed following maternal use of cefaclor.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsSmall amounts of cefaclor are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cefaclor to nursing women. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefaclor in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Dermatologic: Rash (maculopapular, erythematous, or morbilliform) (1% to 2%)

Gastrointestinal: Diarrhea (3%)

Genitourinary: Vaginitis (2%)

Hematologic: Eosinophilia (2%)

Hepatic: Transaminases increased (3%)

Miscellaneous: Moniliasis (2%)

<1%: Agitation, agranulocytosis, anaphylaxis, angioedema, aplastic anemia, arthralgia, cholestatic jaundice, CNS irritability, confusion, dizziness, hallucinations, hemolytic anemia, hepatitis, hyperactivity, insomnia, interstitial nephritis, nausea, nervousness, neutropenia, paresthesia, pruritus, pseudomembranous colitis, PT prolonged, seizure, serum-sickness, somnolence, Stevens-Johnson syndrome, urticaria, thrombocytopenia, toxic epidermal necrolysis, vomiting

Reactions reported with other cephalosporins: Fever, abdominal pain, superinfection, renal dysfunction, toxic nephropathy, hemorrhage, cholestasis

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Cefaclor serum levels may be decreased slightly if taken with food. The bioavailability of cefaclor extended release tablets is decreased 23% and the maximum concentration is decreased 67% when taken on an empty stomach.

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersAssess patient at beginning and throughout therapy for infection; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, nephrotoxicity). Assess results of laboratory tests, therapeutic effectiveness, and adverse effects (hypersensitivity can occur days after therapy is started) regularly during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, opportunistic infection).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at regular intervals around-the-clock (with or without food). Chilling oral suspension improves flavor (do not freeze). Do not chew or crush extended release tablets. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Complete full course of medication, even if you feel better. May cause false test results with Clinitest®; use of another type of testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage; sores in mouth; blood in stool or urine, vaginal itching or drainage, unusual fever or chills); or CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg, 500 mg

Powder for oral suspension: 125 mg/5 mL (75 mL, 150 mL); 250 mg/5 mL (75 mL, 150 mL); 375 mg/5 mL (50 mL, 100 mL)

Tablet, chewable:

Raniclor™: 250 mg [contains phenylalanine 5.6 mg/tablet and tartrazine; fruity flavor]; 375 mg [contains phenylalanine 8.4 mg/tablet and tartrazine; fruity flavor]

Tablet, extended release: 500 mg

Generic AvailableYes: Excludes chewable tablet
Pricing: U.S. (www.drugstore.com)

Capsules (Ceclor)

250 mg (30): $75.99

500 mg (30): $139.99

Capsules (Cefaclor)

250 mg/5 mL (150): $29.99

375 mg/5 mL (50): $22.99

375 mg/5 mL (100): $29.99

Tablet, 12-hour (Cefaclor CR)

500 mg (20): $75.86

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.
Pharmacodynamics/Kinetics

Absorption: Well absorbed, acid stable

Distribution: Widely throughout the body and reaches therapeutic concentration in most tissues and body fluids, including synovial, pericardial, pleural, peritoneal fluids; bile, sputum, and urine; bone, myocardium, gallbladder, skin and soft tissue

Protein binding: 25%

Metabolism: Partially hepatic

Half-life elimination: 0.5-1 hour; prolonged with renal impairment

Time to peak: Capsule: 60 minutes; Suspension: 45 minutes

Excretion: Urine (80% as unchanged drug)

Related Information

- Antimicrobial Drugs of Choice
- Cephalosporins by Generation

Dental Health Professional ConsiderationsPatients allergic to penicillins can use a cephalosporin; the incidence of cross-reactivity between penicillins and cephalosporins is 1% when the allergic reaction to penicillin is delayed. Cefaclor is effective against anaerobic bacteria, but the sensitivity of alpha-hemolytic *Streptococcus* varies; approximately 10% of strains are resistant. Nearly 70% are intermediately sensitive. If the patient has a history of immediate reaction to penicillin, the incidence of cross-reactivity is 20%; cephalosporins are contraindicated in these patients.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause nervousness; case reports of euphoria, delusion, illusions, and depersonalization with cephalosporins
Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine

Cefadroxil

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(sef a DROKS il)

U.S. Brand NamesDuricef® [DSC]

Canadian Brand NamesApo-Cefadroxil®; Duricef®; Novo-Cefadroxil; Pro-Cefadroxil

Pharmacologic CategoryAntibiotic, Cephalosporin (First Generation)

Use: Labeled IndicationsTreatment of susceptible bacterial infections, including those caused by group A beta-hemolytic *Streptococcus*

Use: DentalAlternative antibiotic for treatment of orofacial infections in patients allergic to penicillins; susceptible bacteria including aerobic gram-positive bacteria and anaerobes

Dosing: Adults

Susceptible infections: Oral: 1-2 g/day in 2 divided doses

Orofacial infections: Oral: 250-500 mg every 8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Susceptible infections:** Oral: 30 mg/kg/day divided twice daily up to a maximum of 2 g/day

Dosing: Renal Impairment

Cl_{cr} 10-25 mL/minute: Administer every 24 hours.

Cl_{cr} <10 mL/minute: Administer every 36 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.

ReconstitutionRefrigerate suspension after reconstitution. Discard after 14 days.

ContraindicationsHypersensitivity to cefadroxil, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric ConsiderationsAdjust dose for renal function in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal reproduction studies; therefore, cefadroxil is classified as pregnancy category B. Cefadroxil crosses the placenta. Limited data is available concerning the use of cefadroxil in pregnancy; however, adverse fetal effects were not noted in a small clinical trial. Adequate and well-controlled studies have been not completed in pregnant women.

LactationEnters breast milk (small amounts)/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsVery small amounts of cefadroxil are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cefadroxil to nursing women. The American Academy of Pediatrics considers cefadroxil to be “usually compatible with breastfeeding”. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefadroxil in Pregnancy & Lactation

Adverse Reactions

1% to 10%: Gastrointestinal: Diarrhea

<1%: Anaphylaxis, rash (maculopapular and erythematous), erythema multiforme, Stevens-Johnson syndrome, serum sickness, arthralgia, urticaria, pruritus, angioedema, pseudomembranous colitis, abdominal pain, dyspepsia, nausea, vomiting, cholestasis, vaginitis,

neutropenia, agranulocytosis, thrombocytopenia, transaminases increased, fever

Reactions reported with other cephalosporins: Toxic epidermal necrolysis, abdominal pain, superinfection, renal dysfunction, toxic nephropathy, aplastic anemia, hemolytic anemia, hemorrhage, prothrombin time prolonged, BUN increased, creatinine increased, eosinophilia, pancytopenia, seizure

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Concomitant administration with food, infant formula, or cow's milk does **not** significantly affect absorption.

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose.

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, anticoagulants). Assess results of laboratory tests, therapeutic response, and adverse effects (eg, hypersensitivity can occur several days after therapy is started) regularly during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, opportunistic infection, renal dysfunction, anemia).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at regular intervals around-the-clock (with or without food). Chilling oral suspension improves flavor (do not freeze). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Complete full course of medication, even if you feel better. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage; sores in mouth; blood in urine or stool; unusual fever or chills); or CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Note: Strength is expressed as base

Capsule, as hemihydrate: 500 mg

Capsule, as monohydrate: 500 mg

Powder for oral suspension, as monohydrate: 250 mg/5 mL (100 mL); 500 mg/5 mL (75 mL, 100 mL)

Duricef®: 250 mg/5 mL (50 mL, 100 mL) [DSC]; 500 mg/5 mL (75 mL, 100 mL) [contains sodium benzoate; orange-pineapple flavor] [DSC]

CeFAZolin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

CeFAZolin may be confused with cefprozil, cefTRIAXone, cephalexin, cephalothin

Kefzol® may be confused with Cefzil®

Pronunciation(sef A zoe lin)

Pharmacologic CategoryAntibiotic, Cephalosporin (First Generation)

Use: Labeled IndicationsTreatment of respiratory tract, skin and skin structure, genital, urinary tract, biliary tract, bone and joint infections, and septicemia due to susceptible gram-positive cocci (except enterococcus); some gram-negative bacilli including *E. coli*, *Proteus*, and *Klebsiella* may be susceptible; perioperative prophylaxis

Use: Unlabeled/InvestigationalProphylaxis against infective endocarditis

Use: DentalAlternative antibiotic for prevention of infective endocarditis when parenteral administration is needed. Individuals allergic to amoxicillin (penicillins) may receive cefazolin provided they have not had an immediate, local, or systemic IgE-mediated anaphylactic allergic reaction to penicillin. Alternate antibiotic for premedication in patients not allergic to penicillin who may be at potential increased risk of hematogenous total joint infection when parenteral administration is needed.

Dosing: Adults

Usual dosage range: I.M., I.V.: 1-2 g every 8 hours, depending on severity of infection; maximum: 12 g/day

Mild-to-moderate infections: 500 mg to 1 g every 6-8 hours

Mild infection with gram-positive cocci: 250-500 mg every 8 hours

Perioperative prophylaxis: 1 g given 30 minutes prior to surgery (repeat with 500 mg to 1 g during prolonged surgery); followed by 500 mg to 1 g every 6-9 hours for 24 hours postop

Pneumococcal pneumonia: 500 mg every 12 hours

Severe infection: 1-2 g every 6 hours

Prophylaxis against infective endocarditis (unlabeled use): 1 g 30-60 minutes before procedure. **Note:** Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications.

> **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Prophylaxis in total joint replacement patient: I.M., I.V.: 1 g 1 hour prior to the procedure

UTI (uncomplicated): 1 g every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Usual dosage range: I.M., I.V.: Children >1 month: 25-100 mg/kg/day divided every 6-8 hours; maximum: 6 g/day

Prophylaxis against infective endocarditis (unlabeled use): Infants and Children: 50 mg/kg 30-60 minutes before procedure; maximum dose: 1 g. Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications.

> **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Dosing: Renal Impairment

Cl_{cr} 35-54 mL/minute: Administer full dose in intervals of ≥8 hours

Cl_{cr} 11-34 mL/minute: Administer 1/2 usual dose every 12 hours

Cl_{cr} ≤10 mL/minute: Administer 1/2 usual dose every 18-24 hours

Hemodialysis: Moderately dialyzable (20% to 50%); administer dose postdialysis or administer supplemental dose of 0.5-1 g after dialysis

Continuous ambulatory peritoneal dialysis (CAPD): Administer 0.5 g every 12 hours

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 1-2 g every 12 hours

CVVHD/CVVHDF: 2 g every 12 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.
Administration: I.V.Inject direct I.V. over 5 minutes. Infuse intermittent infusion over 30-60 minutes.

Some penicillins (eg, carbenicillin, ticarcillin, and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered. Refer to Compatibility.

Administration: I.V. DetailpH: 4.5-6.0
Dietary ConsiderationsSodium content of 1 g: 48 mg (2 mEq)
StorageStore intact vials at room temperature and protect from temperatures exceeding 40°C. Reconstituted solutions of cefazolin are light yellow to yellow. Protection from light is recommended for the powder and for the reconstituted solutions. Reconstituted solutions are stable for 24 hours at room temperature and for 10 days under refrigeration. Stability of parenteral admixture at room temperature (25°C) is 48 hours. Stability of parenteral admixture at refrigeration temperature (4°C) is 14 days.

DUPLEX™: Store at 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F) prior to activation. Following activation, stable for 24 hours at room temperature and for 7 days under refrigeration.

ReconstitutionDilute large vial with 2.5 mL SWFI; 10 g vial may be diluted with 45 mL to yield 1 g/5 mL or 96 mL to yield 1 g/10 mL. May be injected or further dilution for I.V. administration in 50-100 mL compatible solution. Standard diluent is 1 g/50 mL D_5W or 2 g/50 mL D_5W.
CompatibilityStable in D_5W, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, $D_{10}W$,LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, atracurium, aztreonam, calcium gluconate, cefpirome, cyclophosphamide, diltiazem, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, insulin (regular), labetalol, lidocaine, linezolid, magnesium sulfate, melphalan, meperidine, midazolam, morphine, multivitamins, ondansetron, pancuronium, perphenazine, propofol, ranitidine, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, vecuronium, vitamin B complex with C, warfarin. **Incompatible:** Amphotericin B cholesteryl sulfate complex, idarubicin, pentamidine, vinorelbine. **Variable (consult detailed reference):** Amiodarone, cisatracurium, hetastarch, hydromorphone, promethazine, vancomycin.

Compatibility in syringe: Compatible: Heparin, vitamin B complex. **Incompatible:** Ascorbic acid injection, cimetidine, lidocaine. **Variable (consult detailed reference):** Hydromorphone, vitamin B complex with C.

Compatibility when admixed: Compatible: Aztreonam, clindamycin, famotidine, fluconazole, linezolid, meperidine, metronidazole, metronidazole with sodium bicarbonate, verapamil. **Incompatible:** Amikacin, amobarbital, atracurium, bleomycin, calcium gluconate, clindamycin with gentamicin, colistimethate, kanamycin, pentobarbital, polymyxin B sulfate, ranitidine. **Variable (consult detailed reference):** Cimetidine.

ContraindicationsHypersensitivity to cefazolin sodium, any component of the formulation, or other cephalosporins
Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Elevated INR: May be associated with increased INR, especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Geriatric ConsiderationsAdjust dose for renal function.
Pregnancy Risk FactorB
Pregnancy ConsiderationsAdverse effects were not observed in animal reproduction studies; therefore, cefazolin is classified as pregnancy category B. Cefazolin crosses the placenta. Adverse events have not been reported in the fetus following administration of cefazolin prior to caesarean section. Cefazolin is recommended for group B streptococcus prophylaxis in pregnant patients with a nonanaphylactic penicillin allergy.

Due to pregnancy-induced physiologic changes, the pharmacokinetics of cefazolin are altered. The half-life is shorter and the AUC is smaller. The volume of distribution is unchanged.

LactationEnters breast milk (small amounts)/use caution (AAP rates “compatible”)
Breast-Feeding ConsiderationsSmall amounts of cefazolin are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cefazolin to nursing women. The American Academy of Pediatrics considers cefazolin to be "usually compatible with breast-feeding." Nondose-related effects could include modification of bowel flora.
Pregnancy & Lactation, In-Depth

- CeFAZolin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Fever, seizure

Dermatologic: Rash, pruritus, Stevens-Johnson syndrome

Gastrointestinal: Diarrhea, nausea, vomiting, abdominal cramps, anorexia, pseudomembranous colitis, oral candidiasis

Genitourinary: Vaginitis

Hepatic: Transaminases increased, hepatitis

Hematologic: Eosinophilia, neutropenia, leukopenia, thrombocytopenia, thrombocytosis

Local: Pain at injection site, phlebitis

Renal: BUN increased, serum creatinine increased, renal failure

Miscellaneous: Anaphylaxis

Reactions reported with other cephalosporins: Toxic epidermal necrolysis, abdominal pain, cholestasis, superinfection, toxic nephropathy, aplastic anemia, hemolytic anemia, hemorrhage, prothrombin time prolonged, pancytopenia

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Cephalosporins may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction.

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersRenal function periodically when used in combination with other nephrotoxic drugs, hepatic function tests, CBC; monitor for signs of anaphylaxis during first dose
Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, anticoagulants). Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypersensitivity can occur several days after therapy is started) regularly during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, opportunistic infection, renal dysfunction, anemia).
Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is administered by injection or infusion. Report immediately any redness, swelling, burning, or pain at injection/infusion site; rash or hives; or respiratory difficulty, chest pain, or difficulty swallowing. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, drug may cause false test results with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); or CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precautions:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [iso-osmotic dextrose solution]: 1 g (50 mL)

Injection, powder for reconstitution: 500 mg, 1 g, 10 g, 20 g

Generic AvailableYes

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: Widely into most body tissues and fluids including gallbladder, liver, kidneys, bone, sputum, bile, pleural, and synovial; CSF penetration is poor

Protein binding: 74% to 86%

Metabolism: Minimally hepatic

Half-life elimination: 90-150 minutes; prolonged with renal impairment

Time to peak, serum: I.M.: 0.5-2 hours

Excretion: Urine (80% to 100% as unchanged drug)

Cefdinir

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SEF di ner)
U.S. Brand NamesOmnicef®
Canadian Brand NamesOmnicef®
Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)
Use: Labeled IndicationsTreatment of community-acquired pneumonia, acute exacerbations of chronic bronchitis, acute bacterial otitis media, acute maxillary sinusitis, pharyngitis/tonsillitis, and uncomplicated skin and skin structure infections.
Dosing: Adults

Acute exacerbations of chronic bronchitis, pharyngitis/tonsillitis: Oral: 300 mg twice daily for 5-10 days **or** 600 mg once daily for 10 days

Acute maxillary sinusitis: Oral: 300 mg twice daily **or** 600 mg once daily for 10 days

Community-acquired pneumonia, uncomplicated skin and skin structure infections: Oral: 300 mg twice daily for 10 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Children 6 months to 12 years:

Acute bacterial otitis media, pharyngitis/tonsillitis: Oral: 7 mg/kg/dose twice daily for 5-10 days **or** 14 mg/kg/dose once daily for 10 days (maximum: 600 mg/day)

Acute maxillary sinusitis: Oral: 7 mg/kg/dose twice daily **or** 14 mg/kg/dose once daily for 10 days (maximum: 600 mg/day)

Uncomplicated skin and skin structure infections: Oral: 7 mg/kg/dose twice daily for 10 days (maximum: 600 mg/day)

Children >12 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute:

Children: 7 mg/kg once daily (maximum: 300 mg/day)

Adults: 300 mg once daily

Hemodialysis removes cefdinir; recommended initial dose: 300 mg (or 7 mg/kg/dose) every other day. At the conclusion of each hemodialysis session, 300 mg (or 7 mg/kg/dose) should be given. Subsequent doses (300 mg or 7 mg/kg/dose) should be administered every other day.

Dosing: Hepatic ImpairmentNo adjustment necessary.
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralTwice daily doses should be given every 12 hours. May be taken with or without food. Manufacturer recommends administering at least 2 hours before or after antacids or iron supplements. Shake suspension well before use.
Dietary ConsiderationsSuspension contains sucrose 2.86 g/5 mL
StorageCapsules and unmixed powder should be stored at room temperature of 15°C to 30°C (59°F to 86°F). After mixing, the suspension can be stored at room temperature of 25°C (77°F) for 10 days.
ReconstitutionOral suspension should be mixed with 38 mL water for the 60 mL bottle and 63 mL of water for the 100 mL bottle.
ContraindicationsHypersensitivity to cefdinir, any component of the formulation, other cephalosporins, or related antibiotics
Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment may be required.

Special populations:

- Pediatrics: Safety and efficacy in infants <6 months of age have not been established.

Geriatric ConsiderationsCefdinir has not been studied exclusively in the elderly. Patients ≥65 years of age have been included in clinical. No information is available on their response or tolerance.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic events have not been observed in animal studies; therefore, cefdinir is classified as pregnancy category B. It is not known if cefdinir crosses the human placenta.
LactationExcretion in breast milk unknown
Breast-Feeding ConsiderationsCefdinir is not detectable in breast milk following a single cefdinir 600 mg dose. It is not known if it would be detectable after multiple doses. If present in breast milk, nondose-related effects could include modification of bowel flora.
Pregnancy & Lactation, In-Depth

- Cefdinir in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (8% to 15%)

1% to 10%:

Central nervous system: Headache (2%)

Dermatologic: Rash (≤3%)

Gastrointestinal: Nausea (≤3%), abdominal pain (≤1%), vomiting (≤1%)

Genitourinary: Vaginal moniliasis (≤4%), urine leukocytes increased (2%), urine protein increased (1% to 2%), vaginitis (≤1%)

Hematologic: Eosinophils increased (1%)

Hepatic: Alkaline phosphatase increased (≤1%), platelets increased (1%)

Renal: Microhematuria (1%)

Miscellaneous: Lymphocytes increased (≤2%), GGT increased (1%), lactate dehydrogenase increased (≤1%), bicarbonate decreased (≤1%), lymphocytes decreased (≤1%), PMN changes (≤1%)

<1% (Limited to important or life-threatening): Anorexia, constipation, cutaneous moniliasis, dizziness, dyspepsia, flatulence, hyperkinesia, insomnia, leukopenia, leukorrhea, maculopapular rash, moniliasis, pruritus, somnolence, stools abnormal, weakness, xerostomia

Postmarketing and/or case reports: Allergic vasculitis, amylase increased, anaphylaxis, bleeding tendency, bloody diarrhea, cardiac failure, chest pain, cholestasis, coagulation disorder, conjunctivitis, disseminated intravascular coagulation (DIC), enterocolitis (acute), eosinophilic pneumonia, erythema multiforme, erythema nodosum, exfoliative dermatitis, facial edema, fever, fulminant hepatitis, granulocytopenia, hemolytic anemia, hemorrhagic colitis, hepatic failure, hepatitis (acute), hypertension, idiopathic thrombocytopenia purpura, ileus, interstitial pneumonia (idiopathic), involuntary movement, jaundice, laryngeal edema, loss of consciousness, melena, myocardial infarction, nephropathy, pancytopenia, peptic ulcer, pneumonia (drug-induced), pseudomembranous colitis, renal failure (acute), respiratory failure (acute), rhabdomyolysis, serum sickness, shock, Stevens-Johnson syndrome, stomatitis, thrombocytopenia, toxic epidermal necrolysis, upper GI bleed

Reactions reported with other cephalosporins: Dizziness, fever, encephalopathy, asterixis, neuromuscular excitability, seizure, aplastic anemia, interstitial nephritis, toxic nephropathy, angioedema, hemorrhage, PT prolonged, and superinfection

Drug Interactions

Iron Salts: May decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Test InteractionsFalse-positive reaction for urinary ketones may occur with nitroprusside- but not nitroferricyanide-based tests. False-positive urine glucose results may occur when using Clinitest®, Benedict's solution, or Fehling's solution; glucose-oxidase-based reaction systems (eg, Clinistix®, Tes-Tape®) are recommended. May cause positive direct Coombs' test.
Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose.
Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess therapeutic response and adverse effects during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, opportunistic infection, hypersensitivity).
Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function.
Patient EducationTake as directed, at regular intervals around-the-clock (with or without food). Avoid taking for 2 hours before or after antacids or iron supplements. Chilling oral suspension improves flavor (do not freeze). Complete full course of medication, even if you feel

better. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause diarrhea (yogurt, boiled milk, or buttermilk may help); or nausea, vomiting, flatulence (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage; sores in mouth; blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 300 mg

Omnicef®: 300 mg

Powder for oral suspension: 125 mg/5 mL (60 mL, 100 mL); 250 mg/5 mL (60 mL, 100 mL)

Omnicef®: 125 mg/5 mL (60 mL, 100 mL) [contains sodium benzoate and sucrose 2.86 g/5 mL; strawberry flavor]; 250 mg/5 mL (60 mL, 100 mL) [contains sodium benzoate and sucrose 2.86 g/5 mL; strawberry flavor]

Medication Safety Issues

International issues:

> Spectracef® may be confused with Spectrocef® which is a brand name for cefotaxime in Italy

Pronunciation(sef de TOR en)
U.S. Brand NamesSpectracef®
Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)
Use: Labeled IndicationsTreatment of acute bacterial exacerbation of chronic bronchitis or community-acquired pneumonia (due to susceptible organisms including *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Streptococcus pneumoniae*-penicillin susceptible only, *Moraxella catarrhalis*); pharyngitis or tonsillitis (*Streptococcus pyogenes*); and uncomplicated skin and skin-structure infections (*Staphylococcus aureus* - not MRSA, *Streptococcus pyogenes*)
Use: DentalBactericidal antibiotic for infections due to susceptible organisms
Dosing: Adults

Acute bacterial exacerbation of chronic bronchitis: Oral: 400 mg twice daily for 10 days

Community-acquired pneumonia: Oral: 400 mg twice daily for 14 days

Dental infections (unlabeled use): Oral: 400 mg twice daily for 10 days

Pharyngitis, tonsillitis, uncomplicated skin and skin structure infections: Oral: 200 mg twice daily for 10 days

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥12 years: Refer to adult dosing.
Dosing: Renal Impairment

Cl_{cr} 30-49 mL/minute/1.73 m^2: Maximum dose: 200 mg twice daily

Cl_{cr} <30 mL/minute/1.73 m^2: Maximum dose: 200 mg once daily

End-stage renal disease: Appropriate dosing not established

Dosing: Hepatic Impairment

Mild-to-moderate impairment: Adjustment not required

Severe impairment (Child-Pugh class C): Specific guidelines not available

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralShould be taken with meals.
Dietary ConsiderationsCefditoren should be taken with meals. Plasma carnitine levels are decreased during therapy (39% with 200 mg dosing, 63% with 400 mg dosing); normal concentrations return within 7-10 days after treatment is discontinued.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light and moisture.
ContraindicationsHypersensitivity to cefditoren, any component of the formulation, other cephalosporins, or milk protein; carnitine deficiency
Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Elevated INR: May be associated with increased INR, especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Carnitine deficiency: Do not use in patients with carnitine deficiency; causes renal excretion of carnitine.
- Hepatic impairment: Use with caution in patients with hepatic impairment
- Renal impairment: Use with caution in patients with renal impairment; modify dosage in moderate to severe impairment.
- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Sodium caseinate: Tablets contain sodium caseinate, which may cause hypersensitivity reactions in patients with milk protein hypersensitivity; this does not affect patients with lactose intolerance.

Other warnings/precautions:

- Duration of therapy: Not for long-term therapy due to the possible development of carnitine deficiency over time.

Geriatric ConsiderationsNo dose adjustment is necessary for patients with normal age-adjusted renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal reproduction studies; therefore, the manufacturer classifies cefditoren as pregnancy category B. Other cephalosporins cross the placenta and are considered safe in pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known whether cefditoren is excreted in human milk. The manufacturer recommends caution when using cefditoren during breast-feeding. Other cephalosporins are considered safe during breast-feeding. If cefditoren reaches the breast milk, the limited oral absorption may minimize the effect on the nursing infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefditoren in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (11% to 15%)

1% to 10%:

Central nervous system: Headache (2% to 3%)

Endocrine & metabolic: Glucose increased (1% to 2%)

Gastrointestinal: Nausea (4% to 6%), abdominal pain (2%), dyspepsia (1% to 2%), vomiting (1%)

Genitourinary: Vaginal moniliasis (3% to 6%)

Hematologic: Hematocrit decreased (2%)

Renal: Hematuria (3%), urinary white blood cells increased (2%)

<1%, postmarketing, and/or case reports: Abnormal dreams, acute renal failure, albumin decreased, allergic reaction, ALT increased, AST increased, anorexia, appetite increased, arthralgia, asthma, BUN increased, calcium decreased, chloride decreased, cholesterol increased, coagulation time increased, constipation, diaphoresis, dizziness, dry mouth, eosinophilic pneumonia, eosinophils increased, eructation, erythema multiforme, facial edema, fever, flatulence, fungal infection, gastritis, gastrointestinal disorder, hemoglobin decreased, hyperglycemia, inorganic phosphorus decreased, insomnia, interstitial pneumonia, leukopenia, leukorrhea, lymphocytes increased, mouth ulceration, myalgia, nervousness, neutrophils decreased, oral moniliasis, pain, peripheral edema, pharyngitis, positive direct Coombs' test, potassium increased, pseudomembranous colitis, proteinuria, pruritus, rash, rhinitis, sinusitis, sodium decreased, somnolence, Stevens-Johnson syndrome, stomatitis, taste perversion, thirst, thrombocythemia, thrombocytopenia, toxic epidermal necrolysis, urinary frequency, urticaria, vaginitis, weakness, weight loss, white blood cell increase/decrease

Reactions reported with other cephalosporins: Anaphylaxis, aplastic anemia, cholestasis, hemorrhage, hemolytic anemia, renal dysfunction, reversible hyperactivity, serum sickness-like reaction, toxic nephropathy

Drug Interactions

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Cephalosporins may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Moderate- to high-fat meals increase bioavailability and maximum plasma concentration.

Test InteractionsMay induce a positive direct Coomb's test. May cause a false-negative ferricyanide test. Glucose oxidase or hexokinase methods recommended for blood/plasma glucose determinations. False-positive urine glucose test when using copper reduction based assays (eg, Clinitest®).

Monitoring ParametersAssess patient at beginning and throughout therapy for infection; monitor for signs of anaphylaxis during first dose.

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess therapeutic response and adverse effects during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, opportunistic infection, gastrointestinal upset, diarrhea).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take as directed, at regular intervals around-the-clock, with food. Maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake). Complete full course of medication, even if you feel better. If you have diabetes, monitor glucose levels closely; may cause false test results with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. May cause diarrhea (yogurt, buttermilk, or boiled milk may help); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, or unusual fever or chills); or CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Spectracef®: 200 mg [contains sodium caseinate]

Generic AvailableNo

ManufacturerTAP Pharmaceuticals Inc

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: 9.3 ± 1.6 L

Protein binding: 88% (*in vitro*), primarily to albumin

Metabolism: Cefditoren pivoxil is hydrolyzed to cefditoren (active) and pivalate

Bioavailability: ~14% to 16%, increased by moderate to high-fat meal

Half-life elimination: 1.6 ± 0.4 hours

Time to peak: 1.5-3 hours

Excretion: Urine (as cefditoren and pivaloylcarnitine)

Related Information

- Cephalosporins by Generation

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause abnormal dreams, insomnia, and dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCefditoren Pivoxil

Special Alerts

Cefepime: Safety Review Ongoing - May 2008

The Food and Drug Administration (FDA) announced that it is continuing to review safety data concerning cefepime. The safety review was initiated in November 2007 following a published meta-analysis (Yahav, 2007) which raised concerns of increased mortality in cefepime treated patients. The FDA will release its conclusions at the completion of the safety review.

Additional information may be found at http://www.fda.gov/medwatch/safety/2007/safety07.htm#Cefepime

Pronunciation(SEF e pim)

U.S. Brand NamesMaxipime®

Canadian Brand NamesMaxipime®

Pharmacologic CategoryAntibiotic, Cephalosporin (Fourth Generation)

Use: Labeled IndicationsTreatment of uncomplicated and complicated urinary tract infections, including pyelonephritis caused by typical urinary tract pathogens; monotherapy for febrile neutropenia; uncomplicated skin and skin structure infections caused by *Streptococcus pyogenes*; moderate-to-severe pneumonia caused by pneumococcus, *Pseudomonas aeruginosa*, and other gram-negative organisms; complicated intra-abdominal infections (in combination with metronidazole). Also active against methicillin-susceptible staphylococci, *Enterobacter* sp, and many other gram-negative bacilli.

Children 2 months to 16 years: Empiric therapy of febrile neutropenia patients, uncomplicated skin/soft tissue infections, pneumonia, and uncomplicated/complicated urinary tract infections.

Dosing: Adults

Brain abscess, postneurosurgical prevention (unlabeled use): I.V.: 2 g every 8 hours with vancomycin

Febrile neutropenia, monotherapy: I.V: 2 g every 8 hours for 7 days or until the neutropenia resolves

Intra-abdominal infections, complicated: I.V.: 2 g every 12 hours for 7-10 days with metronidazole

Otitis externa, malignant (unlabeled use): I.V.: 2 g every 12 hours

Pneumonia: I.V.:

Nosocomial (HAP/VAP): 1-2 g every 8-12 hours; **Note:** Duration of therapy may vary considerably (7-21 days); usually longer courses are required if *Pseudomonas*. In absence of *Pseudomonas*, and if appropriate empiric treatment used and patient responsive, it may be clinically appropriate to reduce duration of therapy to 7-10 days (American Thoracic Society Guidelines, 2005).

Community-acquired (including pseudomonal): 1-2 g every 12 hours for 10 days

Septic lateral/cavernous sinus thrombosis (unlabeled use): I.V.: 2 g every 8-12 hours; with metronidazole for lateral

Skin and skin structure, uncomplicated: I.V.: 2 g every 12 hours for 10 days

Urinary tract infections, complicated and uncomplicated:

Mild-to-moderate: I.M., I.V.: 500-1000 mg every 12 hours for 7-10 days

Severe: I.V.: 2 g every 12 hours for 10 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Febrile neutropenia: I.V.: 50 mg/kg every 8 hours for 7 days or until neutropenia resolves

Skin and skin structure infections (uncomplicated) and pneumonia: I.V.: 50 mg/kg every 12 hours for 10 days

Urinary tract infections, complicated and uncomplicated: I.V., I.M.: 50 mg/kg every 12 hours for 7-10 days; **Note:** I.M. may be considered for mild-to-moderate infection only.

Dosing: Renal Impairment

Adjustment of recommended maintenance schedule is required:

Normal dosing schedule: 500 mg every 12 hours

Cl_{cr} 30-60 mL/minute: 500 mg every 24 hours

Cl_{cr} 11-29 mL/minute: 500 mg every 24 hours

Cl_{cr} <11 mL/minute: 250 mg every 24 hours

Normal dosing schedule: 1 g every 12 hours

Cl_{cr} 30-60 mL/minute: 1 g every 24 hours

Cl_{cr} 11-29 mL/minute: 500 mg every 24 hours

Cl_{cr} <11 mL/minute: 250 mg every 24 hours

Normal dosing schedule: 2 g every 12 hours

Cl_{cr} 30-60 mL/minute: 2 g every 24 hours

Cl_{cr} 11-29 mL/minute: 1 g every 24 hours

Cl_{cr} <11 mL/minute: 500 mg every 24 hours

Normal dosing schedule: 2 g every 8 hours

Cl_{cr} 30-60 mL/minute: 2 g every 12 hours

Cl_{cr} 11-29 mL/minute: 2 g every 24 hours

Cl_{cr} <11 mL/minute: 1 g every 24 hours

Hemodialysis: Initial: 1 g (single dose) on day 1. Maintenance: 500 mg once daily (1 g once daily in febrile neutropenic patients). Dosage should be administered after dialysis on dialysis days.

Continuous ambulatory peritoneal dialysis (CAPD): Removed to a lesser extent than hemodialysis; administer normal recommended dose every 48 hours

Continuous renal replacement therapy (CRRT) (Trotman, 2005): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 1-2 g every 12 hours

CVVHDF: 2 g every 12 hours

Note: Consider higher dosage of 4 g/day if treating *Pseudomonas* or life-threatening infections in order to maximize time above MIC.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.

Administration: I.V.Inject direct I.V. over 5 minutes. Infuse intermittent infusion over 30 minutes.

Administration: I.V. DetailpH: 4-6

StorageStable with normal saline, D_5W, and a variety of other solutions for 24 hours at room temperature and 7 days refrigerated.

CompatibilityStable in D_5LR, D_5NS, D_5W, $D_{10}W$, NS, bacteriostatic water, sterile water for injection; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, co-trimoxazole, cyclophosphamide, cytarabine, dactinomycin, dexamethasone sodium phosphate, docetaxel, doxorubicin liposome, fluconazole, fludarabine, fluorouracil, furosemide, granisetron, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, leucovorin, lorazepam, melphalan, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, paclitaxel, piperacillin/tazobactam, ranitidine, sargramostim, sodium bicarbonate, thiotepa, ticarcillin/clavulanate, zidovudine. **Incompatible:** Acyclovir, amphotericin B, amphotericin B cholesteryl sulfate complex, chlordiazepoxide, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, dacarbazine, daunorubicin, diazepam, diphenhydramine, dobutamine, dopamine, doxorubicin, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, filgrastim, floxuridine, ganciclovir, haloperidol, hydroxyzine, idarubicin, ifosfamide, magnesium sulfate, mannitol, mechlorethamine, meperidine, metoclopramide, mitomycin, mitoxantrone, morphine, nalbuphine, ofloxacin, ondansetron, plicamycin, prochlorperazine edisylate, promethazine, streptozocin, vancomycin, vinblastine, vincristine.

Compatibility when admixed: Compatible: Amikacin, clindamycin, heparin, potassium chloride, theophylline, vancomycin. **Incompatible:** Aminophylline, gentamicin, netilmicin, tobramycin. **Variable (consult detailed reference):** Ampicillin, metronidazole.

ContraindicationsHypersensitivity to cefepime, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Elevated INR: May be associated with increased INR, especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.
- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.
- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Geriatric Considerations Adjust dose for changes in renal function.

Pregnancy Risk Factor B

Pregnancy Considerations Teratogenic effects were not observed in animal studies; therefore, cefepime is classified as pregnancy category B. It is not known if cefepime crosses the human placenta.

Lactation Enters breast milk/use caution

Breast-Feeding Considerations Small amounts of cefepime are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cefepime to nursing women. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefepime in Pregnancy & Lactation

Adverse Reactions

>10%: Hematologic: Positive Coombs' test without hemolysis

1% to 10%:

Central nervous system: Fever (1%), headache (1%)

Dermatologic: Rash, pruritus

Gastrointestinal: Diarrhea, nausea, vomiting

Local: Pain, erythema at injection site

<1%, postmarketing, and/or case reports: Agranulocytosis, anaphylactic shock, anaphylaxis, coma, encephalopathy, hallucinations, leukopenia, myoclonus, neuromuscular excitability, neutropenia, seizure, status epilepticus (nonconvulsive), thrombocytopenia

Reactions reported with other cephalosporins: Aplastic anemia, erythema multiforme, hemolytic anemia, hemorrhage, pancytopenia, PT prolonged, renal dysfunction, Stevens-Johnson syndrome, superinfection, toxic epidermal necrolysis, toxic nephropathy, vaginitis

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Test Interactions Positive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction, false-positive urinary proteins and steroids

Monitoring Parameters Obtain specimen for culture and sensitivity prior to the first dose. Monitor for signs of anaphylaxis during first dose.

Nursing: Physical Assessment/Monitoring Assess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Note I.V. or I.M. administration specifics prior to starting treatment. Assess results of laboratory tests (prothrombin time), therapeutic response, and adverse effects during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, nephrotoxicity, opportunistic infection).

Monitoring: Lab Tests Perform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient Education Do not take any new medication during therapy unless approved by prescriber. This medication is administered by infusion or injection. Report immediately any redness, swelling, burning, or pain at injection/infusion site; itching or hives; chest pain; or difficulty swallowing or breathing. Maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake). May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help); nausea and vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride: 500 mg, 1 g, 2 g

Maxipime®: 500 mg, 1 g, 2 g

Generic AvailableYes

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysis and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: I.M.: Rapid and complete

Distribution: V_d: Adults: 14-20 L; penetrates into inflammatory fluid at concentrations ~80% of serum levels and into bronchial mucosa at levels ~60% of those reached in the plasma; crosses blood-brain barrier

Protein binding, plasma: 16% to 19%

Metabolism: Minimally hepatic

Half-life elimination: 2 hours

Time to peak: 0.5-1.5 hours

Excretion: Urine (85% as unchanged drug)

Related Information

- Antimicrobial Drugs of Choice
- Cephalosporins by Generation
- Community-Acquired Pneumonia in Adults
- Neutropenic Fever Guidelines

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness; case reports of euphoria, delusion, illusions, and depersonalization with cephalosporins; has rarely been associated with encephalopathy (confusion, hallucinations, stupor, and coma); most cases occurred in patients with renal impairment who received doses that exceeded recommendations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsThe Food and Drug Administration (FDA) informed practitioners (November, 2007) of a review of new safety data and a request for additional data for cefepime after a recently published meta-analysis (Yahav, 2007) raised concerns of an increased risk of death in patients treated with cefepime. The authors of the meta-analysis reviewed the results from 57 randomized controlled trials comparing cefepime to other beta-lactams in a variety of infections. The primary outcome of the analysis was 30-day all-cause mortality; however, all-cause mortality data was only available in 41 of the trials. In addition, distribution of specific pathogens to infections in relation to all-cause mortality was not available, including patients with documented gram-negative and *Pseudomonas* infections. The authors reported an increase in all-cause mortality in the cefepime group relative to the comparator group (relative risk 1.26 [95% CI 1.08 to 1.40]; p=0.005). Only two subsets showed a significant difference in all cause mortality and include the group comparing cefepime to piperacillin-tazobactam (relative risk 2.14 [95% CI 1.17 to 3.89]; p=0.01) and the subset of patients with febrile neutropenia (relative risk 1.42 [95% CI 1.09 to 1.84]; p=0.009).

The FDA is currently evaluating the data, and in the interim, is reminding practitioners to consider the risks and benefits of cefepime prior to use. The FDA will provide additional communication and any recommendations, if necessary, following the conclusion of the evaluation, which is expected to take ~4 months (March, 2008).

Additional information may be found at http://www.fda.gov/medwatch/safety/2007/safety07.htm#Cefepime.

Canadian Brand NamesSuprax®

Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)

Use: Labeled IndicationsTreatment of urinary tract infections, otitis media, respiratory infections due to susceptible organisms including *S. pneumoniae* and *S. pyogenes*, *H. influenzae*, and many Enterobacteriaceae; uncomplicated cervical/urethral gonorrhea due to *N. gonorrhoeae*

Dosing: Adults

Susceptible infections: Oral: 400 mg/day divided every 12-24 hours

***S. pyogenes* infections:** Treat for 10 days

Typhoid fever: Oral: 20-30 mg/kg/day in 2 divided doses for 7-14 days after I.V. therapy

Uncomplicated cervical/urethral gonorrhea due to *N. gonorrhoeae*: Oral: 400 mg as a single dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Susceptible infections: Oral:

Children ≥6 months: 8 mg/kg/day divided every 12-24 hours

Children >50 kg or >12 years: Refer to adult dosing.

***S. pyogenes* infections:** Treat for 10 days

Typhoid fever: Oral: 20 mg/kg/day for 10-14 days; maximum 400 mg

Dosing: Renal Impairment

Cl_{cr} 21-60 mL/minute: Administer 75% of the standard dose.

Cl_{cr} <20 mL/minute: Administer 50% of the standard dose.

10% removed by hemodialysis

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be administered with or without food. Administer with food to decrease GI distress. Shake oral suspension well before use.

Dietary ConsiderationsMay be taken with food.

StorageAfter reconstitution, suspension may be stored for 14 days at room temperature or under refrigeration.

ContraindicationsHypersensitivity to cefixime, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage.

Geriatric Considerations

Adjust dose for renal impairment.

Pregnancy Risk Factor

B

Pregnancy Considerations

Teratogenic effects were not observed in animal studies; therefore cefixime is classified as pregnancy category B. It is not known if cefixime crosses the human placenta; other cephalosporins cross the placenta and are considered safe in pregnancy. Congenital anomalies have not been associated with cefixime use during pregnancy (limited data). Cefixime is recommended for use in pregnant women for the treatment of gonococcal infections.

Lactation

Excretion in breast milk unknown

Breast-Feeding Considerations

It is not known if cefixime is excreted in breast milk. The manufacturer recommends that consideration be given to discontinuing nursing temporarily during treatment. Other cephalosporins are considered safe during breast-feeding. If present in breast milk, nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefixime in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (16%)

2% to 10%: Gastrointestinal: Abdominal pain, nausea, dyspepsia, flatulence, loose stools

<2%: Acute renal failure, anaphylactic/anaphylactoid reactions, angioedema, BUN increased, candidiasis, creatinine increased, dizziness, drug fever, eosinophilia, erythema multiforme, facial edema, fever, headache, hepatitis, hyperbilirubinemia, jaundice, leukopenia, neutropenia, pruritus, pseudomembranous colitis, PT prolonged, rash, seizure, serum sickness-like reaction, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, transaminases increased, urticaria, vaginitis, vomiting

Reactions reported with other cephalosporins: Interstitial nephritis, aplastic anemia, hemolytic anemia, hemorrhage, pancytopenia, agranulocytosis, colitis, superinfection

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Delays cefixime absorption.

Test Interactions

Positive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring Parameters

With prolonged therapy, monitor renal and hepatic function periodically. Observe for signs and symptoms of anaphylaxis during first dose.

Nursing: Physical Assessment/Monitoring

Assess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests (prothrombin time), therapeutic response, and adverse effects (eg, anemia, hemorrhage, pancytopenia, agranulocytosis, colitis) during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, opportunistic infection).

Monitoring: Lab Tests

Perform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient Education

Do not take any new medication during therapy unless approved by prescriber. Take as directed, at regular intervals around-the-clock (with or without food). Chilling oral suspension improves flavor (do not freeze); shake suspension thoroughly before using. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Complete full course of medication, even if you feel better. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage; sores in mouth; blood in stool or urine; unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Powder for oral suspension, as trihydrate:

Suprax®: 100 mg/5 mL (50 mL, 75 mL [DSC], 100 mL) [contains sodium benzoate; strawberry flavor]; 200 mg/5 mL (50 mL, 75 mL) [contains sodium benzoate; strawberry flavor]

Tablet, oral, as trihydrate:

Suprax®: 400 mg

Generic AvailableNo

ManufacturerLederle Laboratories

Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (Suprax)

100 mg/5 mL (100): $173.99

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: 40% to 50%

Distribution: Widely throughout the body and reaches therapeutic concentration in most tissues and body fluids, including synovial, pericardial, pleural, peritoneal; bile, sputum, and urine; bone, myocardium, gallbladder, and skin and soft tissue

Protein binding: 65%

Half-life elimination: Normal renal function: 3-4 hours; Renal failure: Up to 11.5 hours

Time to peak, serum: 2-6 hours; delayed with food

Excretion: Urine (50% of absorbed dose as active drug); feces (10%)

Medication Safety Issues

Sound-alike/look-alike issues:

Cefotaxime may be confused with cefoxitin, ceftizoxime, cefuroxime

International issues:

Spectrocef® [Italy] may be confused with Spectracef® which is a brand name for cefditoren in the U.S.

Pronunciation(sef oh TAKS eem)
U.S. Brand NamesClaforan®
Canadian Brand NamesClaforan®
Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)
Use: Labeled IndicationsTreatment of susceptible infection in respiratory tract, skin and skin structure, bone and joint, urinary tract, gynecologic as well as septicemia, and documented or suspected meningitis. Active against most gram-negative bacilli (not *Pseudomonas*) and gram-positive cocci (not enterococcus). Active against many penicillin-resistant pneumococci.
Dosing: Adults

Arthritis (septic): I.V.: 1 g every 8 hours

Brain abscess and meningitis: I.V.: 2 g every 4-6 hours

C-section: 1 g as soon as the umbilical cord is clamped, then 1 g I.M., I.V. at 6- and 12-hours intervals

Epiglottitis: I.V.: 2 g every 4-8 hours

Gonorrhea: I.M.: 1 g as a single dose; disseminated 1 g every 8 hours

Life-threatening infections: I.V.: 2 g every 4 hours

Liver abscess: I.V.: 1-2 g every 6 hours

Lyme disease:

Cardiac manifestations: I.V.: 2 g every 4 hours

CNS manifestations: I.V.: 2 g every 8 hours for 14-28 days

Moderate/severe infections: I.M., I.V.: 1-2 g every 8 hours

Orbital cellulitis: I.V.: 2 g every 4 hours

Peritonitis (spontaneous): I.V.: 2 g every 8 hours, unless life-threatening then 2 g every 4 hours

Septicemia: I.V.: 2 g every 6-8 hours

Skin and soft tissue:

Mixed, necrotizing: I.V.: 2 g every 6 hours, with metronidazole or clindamycin

Bite wounds (animal): I.V.: 2 g every 6 hours

Surgical prophylaxis: I.M., I.V.: 1 g 30-90 minutes before surgery

Uncomplicated infections: I.M., I.V.: 1 g every 12 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Infants and Children 1 month to 12 years:

Susceptible infections: I.M., I.V.: Infants and Children 1 month to 12 years: <50 kg: 50-200 mg/kg/day in divided doses every 6-8 hours

Epiglottitis: I.M., I.V.: 150-200 mg/kg/day in 4 divided doses with clindamycin for 7-10 days

Meningitis: I.M., I.V.: 200 mg/kg/day in divided doses every 6 hours

Pneumonia: I.V.: 200 mg/kg/day divided every 8 hours

Sepsis: I.V.: 150 mg/kg/day divided every 8 hours

Typhoid fever: I.M., I.V.: 150-200 mg/kg/day in 3-4 divided doses (maximum: 12 g/day); fluoroquinolone resistant: 80 mg/kg/day in 3-4 divided doses (maximum: 12 g/day)

Children >12 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 8-12 hours.

Cl_{cr} <10 mL/minute: Administer every 24 hours.

Moderately dialyzable (20% to 50%)

Continuous ambulatory peritoneal dialysis (CAPD): Administer 0.5-1 g every 24 hours

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 1-2 g every 12 hours

CVVHD/CVVHDF: 2 g every 12 hours

Dosing: Hepatic ImpairmentModerate dosage reduction is recommended in severe liver disease.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.

Administration: I.V.Inject direct I.V. over 3-5 minutes. Infuse intermittent infusion over 30 minutes.

Administration: I.V. DetailpH: 5.0-7.5 (injectable solution)

Dietary ConsiderationsSodium content of 1 g: 50.5 mg (2.2 mEq)

ReconstitutionReconstituted solution is stable for 12-24 hours at room temperature and 7-10 days when refrigerated and for 13 weeks when frozen. For I.V. infusion in NS or D_5W, solution is stable for 24 hours at room temperature, 5 days when refrigerated, or 13 weeks when frozen in Viaflex® plastic containers. Thawed solutions previously of frozen premixed bags are stable for 24 hours at room temperature or 10 days when refrigerated.

CompatibilityStable in $D_5{}^{1}/_{4}NS$, $D_5{}^{1}/_{2}NS$, D_5NS, D_5W, $D_{10}W$, LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solutions

Y-site administration: Compatible: Acyclovir, amifostine, aztreonam, cyclophosphamide, diltiazem, docetaxel, etoposide, famotidine, fludarabine, granisetron, hydromorphone, levofloxacin, lorazepam, magnesium sulfate, melphalan, meperidine, midazolam, morphine, ondansetron, perphenazine, propofol, remifentanil, sargramostim, teniposide, thiotepa, tolazoline, vinorelbine. **Incompatible:** Allopurinol, filgrastim, fluconazole, gemcitabine, hetastarch, pentamidine. **Variable (consult detailed reference):** Cisatracurium, vancomycin.

Compatibility in syringe: Compatible: Heparin, ofloxacin. **Incompatible:** Doxapram.

Compatibility when admixed: Compatible: Clindamycin, metronidazole, verapamil. **Incompatible:** Aminoglycosides, aminophylline, sodium bicarbonate.

ContraindicationsHypersensitivity to cefotaxime, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmia: A potentially life-threatening arrhythmia has been reported in patients who received a rapid bolus injection via central line.
- Granulocytopenia: Granulocytopenia and more rarely agranulocytosis may develop during prolonged treatment (>10 days).
- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.
- Tissue inflammation: Minimize tissue inflammation by changing infusion sites when needed.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric ConsiderationsAdjust dose for renal impairment.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; therefore, cefotaxime is classified as pregnancy category

B. Cefotaxime crosses the placenta and can be found in fetal tissue. An increased risk of teratogenic effects has not been observed following maternal use. During pregnancy, peak cefotaxime serum concentrations are decreased and the serum half-life is shorter.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsVery small amounts of cefotaxime are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cefotaxime to nursing women. The American Academy of Pediatrics considers cefotaxime to be "usually compatible with breast-feeding." Nondose-related effects could include modification of bowel flora. The pregnancy-related changes in cefotaxime pharmacokinetics continue into the early postpartum period.

Pregnancy & Lactation, In-Depth

- Cefotaxime in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Dermatologic: Rash, pruritus

Gastrointestinal: Diarrhea, nausea, vomiting, colitis

Local: Pain at injection site

<1%: Anaphylaxis, arrhythmia (after rapid I.V. injection via candidiasis, central catheter), BUN increased, creatinine increased, eosinophilia, erythema multiforme, fever, headache, interstitial nephritis, neutropenia, phlebitis, pseudomembranous colitis, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, transaminases increased, urticaria, vaginitis

Reactions reported with other cephalosporins: Agranulocytosis, aplastic anemia, cholestasis, hemolytic anemia, hemorrhage, pancytopenia, renal dysfunction, seizure, superinfection, toxic nephropathy.

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose; CBC with differential (especially with long courses)

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, nephrotoxicity). Evaluate results of laboratory tests (prothrombin time, CBC with differential), therapeutic response, and adverse effects (diarrhea, nausea/vomiting, nephrotoxicity) regularly during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, opportunistic infection).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; CBC with differential (especially with long courses); renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is administered by injection or infusion. Report immediately any redness, swelling, burning, or pain at injection/infusion site; chest pain, palpitations, respiratory difficulty or swallowing; or itching or hives. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help); GI distress or nausea (small, frequent meals, frequent oral care, chewing gum, or sucking lozenges may help). Report unresolved or persistent diarrhea; opportunistic infection (vaginal itching or drainage, sores in mouth, blood in stool or urine, easy bleeding or bruising, unusual fever or chills); or respiratory difficulty. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed iso-osmotic solution]:

Claforan®: 1 g (50 mL); 2 g (50 mL) [contains sodium 50.5 mg (2.2 mEq) per cefotaxime 1 g]

Injection, powder for reconstitution: 500 mg, 1 g, 2 g, 10 g, 20 g

Claforan®: 500 mg, 1 g, 2 g, 10 g [contains sodium 50.5 mg (2.2 mEq) per cefotaxime 1 g]

Generic AvailableYes: Powder

ManufacturerHoechst-Marion Roussel

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: Widely to body tissues and fluids including aqueous humor, ascitic and prostatic fluids, bone; penetrates CSF best when meninges are inflamed

Metabolism: Partially hepatic to active metabolite, desacetylcefotaxime

Half-life elimination:

Cefotaxime: Premature neonates <1 week: 5-6 hours; Full-term neonates <1 week: 2-3.4 hours; Adults: 1-1.5 hours; prolonged with renal and/or hepatic impairment

Desacetylcefotaxime: 1.5-1.9 hours; prolonged with renal impairment

Time to peak, serum: I.M.: Within 30 minutes

Excretion: Urine (as unchanged drug and metabolites)

Cefotan® may be confused with Cefiton® which is a brand name for cefixime in Portugal

Pronunciation(SEF oh tee tan)

Pharmacologic CategoryAntibiotic, Cephalosporin (Second Generation)

Use: Labeled IndicationsSurgical prophylaxis; intra-abdominal infections and other mixed infections; respiratory tract, skin and skin structure, bone and joint, urinary tract and gynecologic as well as septicemia; active against gram-negative enteric bacilli including *E. coli*, *Klebsiella*, and *Proteus*; less active against staphylococci and streptococci than first generation cephalosporins, but active against anaerobes including *Bacteroides fragilis*

Dosing: Adults

Susceptible infections: I.M., I.V.: 1-6 g/day in divided doses every 12 hours; usual dose: 1-2 g every 12 hours for 5-10 days; 1-2 g may be given every 24 hours for urinary tract infection

Orbital cellulitis, odontogenic infections: I.V.: 2 g every 12 hours

Pelvic inflammatory disease: I.V.: 2 g every 12 hours; used in combination with doxycycline

Preoperative prophylaxis: I.M., I.V.: 1-2 g 30-60 minutes prior to surgery; when used for cesarean section, dose should be given as soon as umbilical cord is clamped

Urinary tract infection: I.M., I.V.: 1-2 g may be given every 24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Severe infections (unlabeled use): I.M., I.V.: 20-40 mg/kg/dose every 12 hours (maximum: 6 g/day)

Preoperative prophylaxis (unlabeled use): I.M., I.V.: 40 mg/kg 30-60 minutes prior to surgery

Pelvic inflammatory disease: Adolescents: I.V.: Refer to adult dosing.

Dosing: Renal ImpairmentI.M., I.V.:

Cl_{cr} 10-30 mL/minute: Administer every 24 hours

Cl_{cr} <10 mL/minute: Administer every 48 hours

Hemodialysis: Dialyzable (5% to 20%); administer $^1/_4$ the usual dose every 24 hours on days between dialysis; administer $^1/_2$ the usual dose on the day of dialysis.

Continuous arteriovenous or venovenous hemodiafiltration effects: Administer 750 mg every 12 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.

Administration: I.V.Inject direct I.V. over 3-5 minutes. Infuse intermittent infusion over 30 minutes.

Administration: I.V. DetailpH: 4.5-6.5 (reconstituted solution)

Dietary ConsiderationsContains sodium of 80 mg (3.5 mEq) per cefotetan 1 g

ReconstitutionReconstituted solution is stable for 24 hours at room temperature and 96 hours when refrigerated. For I.V. infusion in NS or D_5W solution and after freezing, thawed solution is stable for 24 hours at room temperature or 96 hours when refrigerated. Frozen solution is stable for 12 weeks.

Compatibility Stable in D_5W, NS.

Y-site administration: Compatible: Allopurinol, amifostine, aztreonam, diltiazem, docetaxel, etoposide, famotidine, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, granisetron, heparin, insulin (regular), linezolid, melphalan, meperidine, morphine, paclitaxel, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa. **Incompatible:** Promethazine, vinorelbine. **Variable (consult detailed reference):** Cisatracurium, vancomycin.

Compatibility in syringe: Incompatible: Doxapram, promethazine.

Compatibility when admixed: Compatible: Amikacin, aminophylline, ampicillin, atropine, azlocillin, cimetidine, digoxin, dopamine, doxycycline, epinephrine, erythromycin lactobionate, furosemide, kanamycin, multivitamins, oxytocin, penicillin G potassium, piperacillin, ticarcillin, tobramycin, vitamin B complex with C. **Incompatible:** Gentamicin, heparin, tetracyclines.

Contraindications Hypersensitivity to cefotetan, any component of the formulation, or other cephalosporins; previous cephalosporin-associated hemolytic anemia

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Bleeding: Although it contains the methyltetrazolethiol side chain, bleeding has not been a significant problem.

• Elevated INR: May be associated with increased INR, especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.

• Hemolytic anemia: Has been associated with a higher risk of hemolytic anemia relative to other cephalosporins (approximately threefold); monitor carefully during use and consider cephalosporin-associated immune anemia in patients who have received cefotetan within 2-3 weeks (either as treatment or prophylaxis).

• Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

• Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

• Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric Considerations Cefotetan has not been studied in the elderly. Adjust dose for renal function in the elderly.

Pregnancy Risk Factor B

Pregnancy Considerations Adverse events have not been observed in animal reproduction studies; therefore, the manufacturer classifies cefotetan as pregnancy category B. Cefotetan crosses the placenta and produces therapeutic concentrations in the amniotic fluid and cord serum.

Lactation Enters breast milk (small amounts)/use caution

Breast-Feeding Considerations Very small amounts of cefotetan are excreted in human milk. The manufacturer recommends caution when giving cefotetan to a breast-feeding mother. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefotetan in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Gastrointestinal: Diarrhea (1%)

Hepatic: Transaminases increased (1%)

Miscellaneous: Hypersensitivity reactions (1%)

<1%: Anaphylaxis, urticaria, rash, pruritus, pseudomembranous colitis, nausea, vomiting, eosinophilia, thrombocytosis, agranulocytosis, hemolytic anemia, leukopenia, thrombocytopenia, prolonged PT, bleeding, BUN increased, creatinine increased, nephrotoxicity, phlebitis, fever

Reactions reported with other cephalosporins: Seizure, Stevens-Johnson syndrome, toxic epidermal necrolysis, renal dysfunction, toxic nephropathy, cholestasis, aplastic anemia, hemolytic anemia, hemorrhage, pancytopenia, agranulocytosis, colitis, superinfection

Drug Interactions

Alcohol (Ethyl): Cefotetan may enhance the adverse/toxic effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Cephalosporins may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may cause a disulfiram-like reaction).
Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction
Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose; monitor for signs and symptoms of hemolytic anemia, including hematologic parameters where appropriate.
Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests (prothrombin time), therapeutic response, and adverse effects (eg, hemolytic anemia, hypoprothrombinemia, and bleeding) regularly during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, nephrotoxicity, opportunistic infection, hypersensitivity reaction).
Monitoring: Lab TestsProthrombin time; perform culture and sensitivity studies prior to initiating drug therapy; renal function
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is administered by injection or infusion. Report immediately any redness, swelling, burning, or pain at injection/infusion site, or immediately report any itching, hives, difficulty swallowing, or respiratory difficulty. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid alcohol during therapy and for 72 hours after last dose (may cause severe disulfiram-like reactions). May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage; sores in mouth; blood in stool or urine; unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1 g, 2 g [contains sodium 80 mg/g (3.5 mEq/g)]

Generic AvailableYes
ManufacturerAstraZeneca Pharmaceuticals LP
Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.
Pharmacodynamics/Kinetics

Distribution: Widely to body tissues and fluids including bile, sputum, prostatic, peritoneal; low concentrations enter CSF

Protein binding: 76% to 90%

Half-life elimination: 3-5 hours

Time to peak, serum: I.M.: 1.5-3 hours

Excretion: Primarily urine (as unchanged drug); feces (20%)

Medication Safety Issues

Sound-alike/look-alike issues:

Cefoxitin may be confused with cefotaxime, cefotetan, Cytoxan®

Mefoxin® may be confused with Lanoxin®

Pronunciation(se FOKS i tin)

Canadian Brand NamesApo-Cefoxitin®

Pharmacologic CategoryAntibiotic, Cephalosporin (Second Generation)

Use: Labeled IndicationsLess active against staphylococci and streptococci than first generation cephalosporins, but active against anaerobes including *Bacteroides fragilis*; active against gram-negative enteric bacilli including *E. coli*, *Klebsiella*, and *Proteus*; used predominantly for respiratory tract, skin and skin structure, bone and joint, urinary tract and gynecologic as well as septicemia; surgical prophylaxis; intra-abdominal infections and other mixed infections; indicated for bacterial *Eikenella corrodens* infections

Dosing: Adults

Susceptible infections: I.M., I.V.: 1-2 g every 6-8 hours (I.M. injection is painful); up to 12 g/day

Amnionitis and endomyometritis: I.M., I.V.: 2 g every 6-8 hours

Aspiration pneumonia, empyema, orbital cellulitis, parapharyngeal space, and human bites: I.M., I.V.: 2 g every 8 hours

Liver abscess: I.V.: 1 g every 4 hours

Mycobacterium species, not MTB or MAI: I.V.: 12 g/day with amikacin

Pelvic inflammatory disease:

Inpatients: I.V.: 2 g every 6 hours **plus** doxycycline 100 mg I.V. or 100 mg orally every 12 hours until improved, followed by doxycycline 100 mg orally twice daily to complete 14 days

Outpatients: I.M.: 2 g **plus** probenecid 1 g orally as a single dose, followed by doxycycline 100 mg orally twice daily for 14 days

Perioperative prophylaxis: I.M., I.V.: 1-2 g 30-60 minutes prior to surgery followed by 1-2 g every 6-8 hours for no more than 24 hours after surgery depending on the procedure

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Perioperative prophylaxis: I.V.:

Infants >3 months and Children: 30-40 mg/kg 30-60 minutes prior to surgery followed by 30-40 mg/kg/dose every 6 hours for no more than 24 hours after surgery depending on the procedure

Adolescents: Refer to adult dosing.

Mild-to-moderate infection: I.M., I.V.: Infants >3 months and Children: 80-100 mg/kg/day in divided doses every 4-6 hours

Severe infection: I.M., I.V.: Infants >3 months and Children: 100-160 mg/kg/day in divided doses every 4-6 hours

Maximum dose: 12 g/day

Dosing: Renal ImpairmentI.M., I.V.:

Cl_{cr} 30-50 mL/minute: Administer 1-2 g every 8-12 hours

Cl_{cr} 10-29 mL/minute: Administer 1-2 g every 12-24 hours

Cl_{cr} 5-9 mL/minute: Administer 0.5-1 g every 12-24 hours

Cl_{cr} <5 mL/minute: Administer 0.5-1 g every 24-48 hours

Hemodialysis: Moderately dialyzable (20% to 50%); administer a loading dose of 1-2 g after each hemodialysis; maintenance dose as noted above based on Cl_{cr}

Continuous arteriovenous or venovenous hemodiafiltration effects: Dose as for Cl_{cr} 10-50 mL/minute

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.

Administration: I.V.Can be administered IVP over 3-5 minutes at a maximum concentration of 100 mg/mL or I.V. intermittent infusion over 10-60 minutes at a final concentration for I.V. administration not to exceed 40 mg/mL

Administration: I.V. DetailpH: 4.2-7.0 (reconstituted solution); 6.5 (frozen premixed solution)

Dietary ConsiderationsSodium content of 1 g: 53 mg (2.3 mEq)

StorageReconstituted solution is stable for 6 hours at room temperature or 7 days when refrigerated; I.V. infusion in NS or D_5W solution is stable for 18 hours at room temperature or 48 hours when refrigerated. Premixed frozen solution, when thawed, is stable for 24 hours at room temperature or 21 days when refrigerated.

ReconstitutionReconstitute vials with SWFI, bacteriostatic water for injection, NS, or D_5W. For I.V. infusion, solutions may be further diluted in NS, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, D_5LR, mannitol 10%, or sodium bicarbonate 5%.

CompatibilityStable in D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, NS, mannitol 10%, sodium bicarbonate 5%; **variable stability (consult detailed reference)** in peritoneal dialysis solution.

Y-site administration: Compatible: Acyclovir, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, cyclophosphamide, diltiazem, docetaxel, doxorubicin liposome, etoposide, famotidine, fluconazole, foscarnet, gemcitabine, granisetron, hydromorphone, linezolid, magnesium sulfate, meperidine, morphine, ondansetron, perphenazine, propofol, ranitidine, remifentanil, teniposide, thiotepa. **Incompatible:** Filgrastim, gatifloxacin, hetastarch, pentamidine. **Variable (consult detailed reference):** Cisatracurium, vancomycin.

Compatibility in syringe: Compatible: Heparin.

Compatibility when admixed: Compatible: Amikacin, cimetidine, clindamycin, gentamicin, kanamycin, metronidazole, metronidazole with sodium bicarbonate, multivitamins, sodium bicarbonate, tobramycin, verapamil, vitamin B complex with C. **Incompatible:** Ranitidine. **Variable (consult detailed reference):** Aztreonam.

ContraindicationsHypersensitivity to cefoxitin, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric ConsiderationsAdjust dose for renal function in the elderly.

Pregnancy Risk FactorB

Pregnancy Considerations

Adverse events have not been observed in animal reproduction studies; therefore, cefoxitin is classified as pregnancy category B. Cefoxitin crosses the placenta and reaches the cord serum and amniotic fluid. Adequate well-controlled studies are not available in pregnant women.

Peak serum concentrations of cefoxitin during pregnancy may be similar to or decreased compared to nonpregnant values. Maternal half-life may be shorter at term. Pregnancy-induced hypertension increases trough concentrations in the immediate postpartum period.

LactationEnters breast milk (small amounts)/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsVery small amounts of cefoxitin are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cefoxitin to nursing women. The American Academy of Pediatrics considers cefoxitin to be "usually compatible with breast-feeding." Nondose-related effects could include modification of bowel flora. Cefoxitin pharmacokinetics may be altered immediately postpartum.

Pregnancy & Lactation, In-Depth

- Cefoxitin in Pregnancy & Lactation

Adverse Reactions

1% to 10%: Gastrointestinal: Diarrhea

<1%: Anaphylaxis, angioedema, bone marrow suppression, BUN increased, creatinine increased, dyspnea, eosinophilia, exacerbation of myasthenia gravis, exfoliative dermatitis, fever, hemolytic anemia, hypotension, interstitial nephritis, jaundice, leukopenia, nausea, nephrotoxicity increased (with aminoglycosides), phlebitis, prolonged PT, pruritus, pseudomembranous colitis, rash, thrombocytopenia, thrombophlebitis, toxic epidermal necrolysis, transaminases increased, urticaria, vomiting

Reactions reported with other cephalosporins: Agranulocytosis, aplastic anemia, cholestasis, colitis, erythema multiforme, hemolytic anemia, hemorrhage, pancytopenia, renal dysfunction, serum-sickness reactions, seizure, Stevens-Johnson syndrome, superinfection, toxic nephropathy, vaginitis

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Cephalosporins may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersMonitor renal function periodically when used in combination with other nephrotoxic drugs; observe for signs and symptoms of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, nephrotoxicity). Evaluate results of laboratory tests (prothrombin time, CBC with differential), therapeutic response, and adverse effects (diarrhea, nausea/vomiting, nephrotoxicity) on a regular basis during therapy. Advise patients with diabetes about use of Clinitest®. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, hypersensitivity, opportunistic infection).

Monitoring: Lab TestsProthrombin times; perform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is administered by injection or infusion. Report immediately any redness, swelling, burning, or pain at injection/infusion site; chest pain, palpitations, respiratory difficulty or swallowing; itching or hives. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help); GI distress or nausea (small, frequent meals, frequent oral care, chewing gum, or sucking lozenges may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1 g, 2 g, 10 g [contains sodium 53.8 mg/g (2.3 mEq/g)]

Powder for prescription compounding: 100 g

Generic AvailableYes

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: Widely to body tissues and fluids including pleural, synovial, ascitic, bile; poorly penetrates into CSF even with inflammation of the meninges

Protein binding: 65% to 79%

Half-life elimination: 45-60 minutes; significantly prolonged with renal impairment

Time to peak, serum: I.M.: 20-30 minutes

Excretion: Urine (85% as unchanged drug)

Medication Safety Issues

Sound-alike/look-alike issues:

Vantin® may be confused with Ventolin®

Pronunciation(sef pode OKS eem)

U.S. Brand NamesVantin®

Canadian Brand NamesVantin®

Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)

Use: Labeled IndicationsTreatment of susceptible acute, community-acquired pneumonia caused by *S. pneumoniae* or nonbeta-lactamase producing *H. influenzae*; acute uncomplicated gonorrhea caused by *N. gonorrhoeae*; uncomplicated skin and skin structure infections caused by *S. aureus* or *S. pyogenes*; acute otitis media caused by *S. pneumoniae*, *H. influenzae*, or *M. catarrhalis*; pharyngitis or tonsillitis; and uncomplicated urinary tract infections caused by *E. coli*, *Klebsiella*, and *Proteus*

Dosing: Adults

Acute community-acquired pneumonia and bacterial exacerbations of chronic bronchitis: Oral: 200 mg every 12 hours for 14 days and 10 days, respectively

Acute maxillary sinusitis: Oral: 200 mg every 12 hours for 10 days

Pharyngitis/tonsillitis: Oral: 100 mg every 12 hours for 5-10 days

Skin and skin structure: Oral: 400 mg every 12 hours for 7-14 days

Uncomplicated gonorrhea (male and female) and rectal gonococcal infections (female): Oral: 200 mg as a single dose

Uncomplicated urinary tract infection: Oral: 100 mg every 12 hours for 7 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Acute maxillary sinusitis: Oral: Children: 2 months to 12 years: 10 mg/kg/day divided every 12 hours for 10 days (maximum: 200 mg/dose)

Acute otitis media: Oral: Children:

≥12 years: 2 months to 12 years: 10 mg/kg/day divided every 12 hours (400 mg/day) for 5 days (maximum: 200 mg/dose)

≥12 years: Refer to adult dosing.

Pharyngitis/tonsillitis: Oral: Children:

2 months to 12 years: 10 mg/kg/day in 2 divided doses for 5-10 days (maximum: 100 mg/dose)

≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: Administer every 24 hours.

Hemodialysis: Dose 3 times/week following dialysis.

Dosing: Hepatic ImpairmentDose adjustment is not necessary in patients with cirrhosis.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.

Dietary ConsiderationsMay be taken with food.

ReconstitutionShake well before using. After mixing, keep suspension in refrigerator. Discard unused portion after 14 days.

ContraindicationsHypersensitivity to cefpodoxime, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric ConsiderationsConsidered one of the drugs of choice for outpatient treatment of community-acquired pneumonia in the elderly. Adjust dosage with renal impairment.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic events were not observed in animal studies; therefore, cefpodoxime is classified as pregnancy category B. It is not known if cefpodoxime crosses the human placenta. Other cephalosporins cross the placenta and are considered safe in pregnancy.

LactationEnters breast milk (small amounts)/not recommended

Breast-Feeding ConsiderationsVery small amounts of cefpodoxime are excreted in breast milk. Breast-feeding is not recommended by the manufacturer. Other cephalosporins are considered safe during breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

Adverse Reactions

>10%:

Dermatologic: Diaper rash (12%)

Gastrointestinal: Diarrhea in infants and toddlers (15%)

1% to 10%:

Central nervous system: Headache (1%)

Dermatologic: Rash (1%)

Gastrointestinal: Diarrhea (7%), nausea (4%), abdominal pain (2%), vomiting (1% to 2%)

Genitourinary: Vaginal infection (3%)

<1%: Anaphylaxis, chest pain, hypotension, fungal skin infection, pseudomembranous colitis, vaginal candidiasis, pruritus, flatulence, decreased salivation, malaise, fever, decreased appetite, cough, epistaxis, dizziness, fatigue, anxiety, insomnia, flushing, weakness, nightmares, taste alteration, eye itching, tinnitus, purpuric nephritis

Reactions reported with other cephalosporins: Seizure, Stevens-Johnson syndrome, toxic epidermal necrolysis, erythema multiforme, urticaria, serum-sickness reactions, renal dysfunction, interstitial nephritis toxic nephropathy, cholestasis, aplastic anemia, hemolytic anemia, hemorrhage, pancytopenia, agranulocytosis, colitis, vaginitis, superinfection

Drug Interactions

Antacids: May decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

H2-Antagonists: May decrease the absorption of Cefpodoxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food delays absorption; cefpodoxime serum levels may be increased if taken with food.

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests (prothrombin time), therapeutic response, and adverse effects (eg, hemolytic anemia, hypoprothrombinemia, and bleeding) regularly during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, nephrotoxicity, opportunistic infection, hypersensitivity reaction).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at regular intervals around-the-clock (with or without food). Chilling oral suspension improves flavor (do not freeze); shake well before using. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Complete full course of medication, even if you feel better. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Granules for oral suspension: 50 mg/5 mL (50 mL, 75 mL, 100 mL); 100 mg/5 mL (50 mL, 75 mL, 100 mL)

Vantin®: 50 mg/5 mL (100 mL) [contains sodium benzoate; lemon creme flavor] [DSC]; 100 mg/5 mL (100 mL) [contains sodium benzoate; lemon creme flavor] [DSC]

Tablet: 100 mg, 200 mg

Vantin®: 100 mg, 200 mg

Generic Available Yes

Manufacturer Pharmacia & Upjohn

Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (Vantin)

50 mg/5 mL (50): $33.99

50 mg/5 mL (100): $61.99

100 mg/5 mL (50): $56.99

100 mg/5 mL (100): $113.99

Tablets (Cefpodoxime Proxetil)

200 mg (20): $114.03

Tablets (Vantin)

100 mg (20): $127.59

200 mg (20): $168.29

Mechanism of Action Inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: Rapid and well absorbed (50%), acid stable; enhanced in the presence of food or low gastric pH

Distribution: Good tissue penetration, including lung and tonsils; penetrates into pleural fluid

Protein binding: 18% to 23%

Metabolism: De-esterified in GI tract to active metabolite, cefpodoxime

Half-life elimination: 2.2 hours; prolonged with renal impairment

Time to peak: Within 1 hour

Excretion: Urine (80% as unchanged drug) in 24 hours

Medication Safety Issues

Sound-alike/look-alike issues:

Cefprozil may be confused with ceFAZolin, cefuroxime

Cefzil® may be confused with Cefol®, Ceftin®, Kefzol®

Pronunciation(sef PROE zil)
Canadian Brand NamesApo-Cefprozil®; Cefzil®; Ran-Cefprozil; Sandoz-Cefprozil
Pharmacologic CategoryAntibiotic, Cephalosporin (Second Generation)
Use: Labeled IndicationsTreatment of otitis media and infections involving the respiratory tract and skin and skin structure; active against methicillin-sensitive staphylococci, many streptococci, and various gram-negative bacilli including *E. coli*, some *Klebsiella*, *P. mirabilis*, *H. influenzae*, and *Moraxella*.
Dosing: Adults

Pharyngitis/tonsillitis: Oral: 500 mg every 24 hours for 10 days

Secondary bacterial infection of acute bronchitis or acute bacterial exacerbation of chronic bronchitis: Oral: 500 mg every 12 hours for 10 days

Uncomplicated skin and skin structure infections: Oral: 250 mg every 12 hours, or 500 mg every 12-24 hours for 10 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Otitis media: Oral: Children >6 months to 12 years: 15 mg/kg every 12 hours for 10 days

Pharyngitis/tonsillitis: Oral: Children:

2-12 years: 7.5-15 mg/kg/day divided every 12 hours for 10 days (administer for >10 days if due to *S. pyogenes*); maximum: 1 g/day

≥13 years: Refer to adult dosing.

Uncomplicated skin and skin structure infections: Oral:

2-12 years: 20 mg/kg every 24 hours for 10 days; maximum: 1 g/day

≥13 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: Reduce dose by 50%.

Hemodialysis effects: 55% is removed by hemodialysis.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels. Chilling the reconstituted oral suspension improves flavor (do not freeze).
Dietary ConsiderationsMay be taken with food. Oral suspension contains phenylalanine 28 mg/5 mL.
ContraindicationsHypersensitivity to cefprozil, any component of the formulation, or other cephalosporins
Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Geriatric ConsiderationsHas not been studied exclusively in the elderly. Adjust dose for estimated renal function.
Pregnancy Risk FactorB
Pregnancy ConsiderationsAdverse events were not observed in animal reproduction studies; therefore, cefprozil is classified as pregnancy category B. It is not known if cefprozil crosses the human placenta. Other cephalosporins cross the placenta and are considered safe for use during pregnancy.
LactationEnters breast milk/use caution (AAP rates “compatible”)
Breast-Feeding Considerations

Small amounts of cefprozil are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cefprozil to nursing women. The American Academy of Pediatrics considers cefprozil to be “usually compatible with breastfeeding.” Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefprozil in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (1%)

Dermatologic: Diaper rash (2%)

Gastrointestinal: Diarrhea (3%), nausea (4%), vomiting (1%), abdominal pain (1%)

Genitourinary: Vaginitis, genital pruritus (2%)

Hepatic: Transaminases increased (2%)

Miscellaneous: Superinfection

<1%: Anaphylaxis, angioedema, pseudomembranous colitis, rash, urticaria, erythema multiforme, serum sickness, Stevens-Johnson syndrome, hyperactivity, headache, insomnia, confusion, somnolence, leukopenia, eosinophilia, thrombocytopenia, BUN increased, creatinine increased, arthralgia, cholestatic jaundice, fever

Reactions reported with other cephalosporins: Seizure, toxic epidermal necrolysis, renal dysfunction, interstitial nephritis, toxic nephropathy, aplastic anemia, hemolytic anemia, hemorrhage, pancytopenia, agranulocytosis, colitis, vaginitis, superinfection

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food delays cefprozil absorption.
Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction
Monitoring ParametersAssess patient at beginning and throughout therapy for infection; monitor for signs of anaphylaxis during first dose
Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, interstitial nephritis, hemolytic anemia, hemorrhage). Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, opportunistic infection, hypersensitivity reactions).
Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at regular intervals around-the-clock (with or without food). Chilling oral suspension improves flavor (do not freeze). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Complete full course of medication, even if you feel better. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause dizziness (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for oral suspension, as anhydrous: 125 mg/5 mL (50 mL, 75 mL, 100 mL); 250 mg/5 mL (50 mL, 75 mL, 100 mL)

Tablet, as anhydrous: 250 mg, 500 mg

Generic AvailableYes

Pronunciation(SEF tay zi deem)

U.S. Brand NamesFortaz®; Tazicef®

Canadian Brand NamesFortaz®

Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)

Use: Labeled IndicationsTreatment of documented susceptible *Pseudomonas aeruginosa* infection and infections due to other susceptible aerobic gram-negative organisms; empiric therapy of a febrile, granulocytopenic patient

Use: Unlabeled/InvestigationalBacterial endophthalmitis

Dosing: Adults

Bacterial arthritis (gram negative bacilli): I.V.: 1-2 g every 8 hours

Bone and joint infections: I.V.: 2 g every 12 hours

Cystic fibrosis, lung infection caused by *Pseudomonas*spp: I.V.: 30-50 mg/kg every 8 hours (maximum: 6 g/day)

Endophthalmitis, bacterial (unlabeled use): Intravitreal: 2.25 mg/0.1 mL NS in combination with vancomycin

Melioidosis: I.V.: 40 mg/kg every 8 hours for 10 days, followed by oral therapy with doxycycline or TMP/SMX

Otitis externa: I.V.: 2 g every 8 hours

Peritonitis (CAPD):

Anuric, intermittent: 1000-1500 mg/day

Anuric, continuous (per liter exchange): Loading dose: 250 mg; maintenance dose: 125 mg

Pneumonia: I.V.:

Uncomplicated: 500 mg to 1 g every 8 hours

Complicated or severe: 2 g every 8 hours

Skin and soft tissue infections: I.V., I.M.: 500 mg to 1 g every 8 hours

Severe infections, including meningitis, complicated pneumonia, endophthalmitis, CNS infection, osteomyelitis, intra-abdominal and gynecological, skin and soft tissue: I.V.: 2 g every 8 hours

Urinary tract infections: I.V., I.M.:

Uncomplicated: 250 mg every 12 hours

Complicated: 500 mg every 8-12 hours

Dosing: ElderlyI.M., I.V.: Dosage should be based on renal function with a dosing interval not more frequent then every 12 hours.

Dosing: PediatricSusceptible infections: I.V.:

Children 1 month to 12 years: 30-50 mg/kg/dose every 8 hours; maximum dose: 6 g/day (higher doses reserved for immunocompromised patients, cystic fibrosis, or meningitis)

Children ≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-50 mL/minute: Administer every 12 hours

Cl_{cr} 10-30 mL/minute: Administer every 24 hours

Cl_{cr} <10 mL/minute: Administer every 48-72 hours

Hemodialysis: Dialyzable (50% to 100%)

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 1-2 g every 12 hours

CVVHD/CVVHDF: 2 g every 12 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large mass muscle.

Administration: I.V.Ceftazidime can be administered IVP over 3-5 minutes or I.V. intermittent infusion over 15-30 minutes.

Administration: I.V. DetailAny carbon dioxide bubbles that may be present in the withdrawn solution should be expelled prior to injection. Administer around-the-clock to promote less variation in peak and trough serum levels.

pH: 5-8 (Fortaz®); 5.0-7.5 (Ceptaz®)

Dietary ConsiderationsSodium content of 1 g: 2.3 mEq

Storage

Vials: Reconstituted solution and solution further diluted for I.V. infusion are stable for 12 hours at room temperature, for 3 days when refrigerated, or for 12 weeks when frozen at -20°C (-4°F). After freezing, thawed solution in SWFI for I.M. administration is stable for 3 hours at room temperature or for 3 days when refrigerated, thawed solution in NS in a Viaflex® small volume container for I.V. administration is stable for 12 hours at room temperature or for 3 days when refrigerated, and thawed solution in SWFI in the original container is stable for 8 hours at room temperature or for 3 days when refrigerated.

Premixed frozen solution: Store frozen at -20°C (-4°F). Thawed solution is stable for 8 hours at room temperature or for 3 days under refrigeration; do not refreeze.

CompatibilityStable in D_5NS, D_5W, NS, sterile water for injection; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, aminophylline, aztreonam, ciprofloxacin, diltiazem, docetaxel, enalaprilat, esmolol, etoposide phosphate, famotidine, filgrastim, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, hydromorphone, labetalol, linezolid, melphalan, meperidine, morphine, ondansetron, paclitaxel, propofol, ranitidine, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine, zidovudine. **Incompatible:** Alatrofloxacin, amphotericin B cholesteryl sulfate complex, amsacrine, doxorubicin liposome, fluconazole, idarubicin, midazolam, pentamidine, warfarin. **Variable (consult detailed reference):** Cisatracurium, sargramostim, vancomycin.

Compatibility in syringe: Compatible: Hydromorphone.

Compatibility when admixed: Compatible: Ciprofloxacin, clindamycin, fluconazole, linezolid, metronidazole, ofloxacin. **Incompatible:** Aminoglycosides (in same bottle/bag), aminophylline, ranitidine. **Variable (consult detailed reference):** Vancomycin.

ContraindicationsHypersensitivity to ceftazidime, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Elevated INR: May be associated with increased INR, especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.
- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.
- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Geriatric ConsiderationsChanges in renal function associated with aging and corresponding alterations in pharmacokinetics result in every 12-hour dosing being an adequate dosing interval. Adjust dose based on renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; therefore, ceftazidime is classified as pregnancy category B. Ceftazidime crosses the placenta and reaches the cord serum and amniotic fluid. Maternal peak serum concentration is unchanged in the first trimester. After the first trimester, serum concentrations decrease by approximately 50% of those in nonpregnant patients. Renal clearance is increased during pregnancy.

LactationEnters breast milk (small amounts)/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsVery small amounts of ceftazidime are excreted in breast milk. The manufacturer recommends that caution be exercised when administering ceftazidime to nursing women. The American Academy of Pediatrics considers ceftazidime to be "usually compatible with breast-feeding." Ceftazidime in not absorbed when given orally; therefore, any medication that is distributed to human milk should not result in systemic concentrations in the nursing infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Ceftazidime in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Gastrointestinal: Diarrhea (1%)

Local: Pain at injection site (1%)

Miscellaneous: Hypersensitivity reactions (2%)

<1%: Anaphylaxis, angioedema, asterixis, BUN increased, candidiasis, creatinine increased, dizziness, encephalopathy, eosinophilia, erythema multiforme, fever, headache, hemolytic anemia, hyperbilirubinemia, jaundice, leukopenia, myoclonus, nausea, neuromuscular excitability, paresthesia, phlebitis, pruritus, pseudomembranous colitis, rash, Stevens-Johnson syndrome, thrombocytosis, toxic epidermal necrolysis, transaminases increased, vaginitis, vomiting

Reactions reported with other cephalosporins: Seizure, urticaria, serum-sickness reactions, renal dysfunction, interstitial nephritis, toxic nephropathy, elevated BUN, elevated creatinine, cholestasis, aplastic anemia, hemolytic anemia, pancytopenia, agranulocytosis, colitis, prolonged PT, hemorrhage, superinfection

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy (eg, nephrotoxicity). Assess results of laboratory tests (prothrombin time), therapeutic response, and adverse effects (eg, hemolytic anemia, hypoprothrombinemia, and bleeding) during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, opportunistic infection, hypersensitivity reaction).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is administered by infusion or injection. Report immediately any redness, swelling, burning, or pain at injection/infusion site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed iso-osmotic solution, frozen]:

Fortaz®: 1 g (50 mL) [contains sodium carbonate, sodium ~54 mg (2.3 mEq)/g]; 2 g (50 mL) [contains sodium ~54 mg (2.3 mEq)/g]

Injection, powder for reconstitution: 1 g, 2 g, 6 g

Fortaz®: 500 mg, 1 g, 2 g, 6 g [contains sodium ~54 mg (2.3 mEq)/g]

Tazicef®: 1 g, 2 g, 6 g [contains sodium ~54 mg (2.3 mEq)/g]

Generic AvailableYes: Injection

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: Widely throughout the body including bone, bile, skin, CSF (higher concentrations achieved when meninges are inflamed), endometrium, heart, pleural and lymphatic fluids

Protein binding: 17%

Half-life elimination: 1-2 hours, prolonged with renal impairment; Neonates <23 days: 2.2-4.7 hours

Time to peak, serum: I.M.: ~1 hour

Excretion: Urine (80% to 90% as unchanged drug)

Related Information

- Antimicrobial Drugs of Choice
- Cephalosporins by Generation
- Neutropenic Fever Guidelines

Pharmacotherapy PearlsWith some organisms, resistance may develop during treatment (including *Enterobacter* spp and *Serratia* spp). Consider combination therapy or periodic susceptibility testing for organisms with inducible resistance.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness; case reports of euphoria, delusion, illusions, and depersonalization with cephalosporins

Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine

Medication Safety Issues

International issues:

Cedax® may be confused with Codex which is a brand name for *Saccharomyces boulardii* in Italy

Pronunciation(sef TYE byoo ten)

U.S. Brand NamesCedax®

Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)

Use: Labeled IndicationsOral cephalosporin for treatment of bronchitis, otitis media, and pharyngitis/tonsillitis due to *H. influenzae* and *M. catarrhalis*, both beta-lactamase-producing and nonproducing strains, as well as *S. pneumoniae* (weak) and *S. pyogenes*

Dosing: AdultsSusceptible infections: Oral: 400 mg once daily for 10 days; maximum: 400 mg

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSusceptible infections: Oral:

<12 years: 9 mg/kg/day for 10 days; maximum daily dose: 400 mg

≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-49 mL//minute: Administer 4.5 mg/kg or 200 mg every 24 hours.

Cl_{cr} 5-29 mL/minute: Administer 2.25 mg/kg or 100 mg every 24 hours.

Hemodialysis: Administer 400 mg or 9 mg/kg (maximum: 400 mg) after hemodialysis

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister at the same time each day to maintain adequate blood levels. Shake suspension well before use.

Dietary Considerations

Capsule: Take without regard to food.

Suspension: Take 2 hours before or 1 hour after meals; contains 1 g of sucrose per 5 mL

StorageReconstituted suspension is stable for 14 days when refrigerated.

ContraindicationsHypersensitivity to ceftibuten, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric ConsiderationsHas not been studied specifically in the elderly. Adjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; therefore, ceftibuten is classified as pregnancy category B. It is not know if ceftibuten crosses the placenta; other cephalosporins cross the placenta and are considered safe for use during pregnancy. Adequate and well-controlled studies have been completed in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsCeftibuten was not detectable in milk after a single 200 mg dose (limit of detection 1 mcg/mL). It is not known if it would be detectable after a 400 mg dose or multiple doses. The manufacturer recommends that caution be exercised when administering ceftibuten to nursing women. If ceftibuten does reach the human milk, nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Ceftibuten in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Headache (3%), dizziness (1%)

Gastrointestinal: Nausea (4%), diarrhea (3%), dyspepsia (2%), vomiting (1%), abdominal pain (1%)

Hematologic: Eosinophils increased (3%), hemoglobin decreased (2%), thrombocytosis

Hepatic: ALT increased (1%), bilirubin increased (1%)

Renal: BUN increased (4%)

<1%: Anorexia, agitation, constipation, creatinine increased, diaper rash, dry mouth, dyspnea, dysuria, fatigue, candidiasis, rash, urticaria, irritability, paresthesia, nasal congestion, insomnia, rigors, transaminases increased, leukopenia

Reactions reported with other cephalosporins: Anaphylaxis, fever, paresthesia, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, erythema multiforme, angioedema, pseudomembranous colitis, hemolytic anemia, candidiasis, vaginitis, encephalopathy, asterixis, neuromuscular excitability, seizure, serum-sickness reactions, renal dysfunction, interstitial nephritis, toxic nephropathy, cholestasis, aplastic anemia, hemolytic anemia, pancytopenia, agranulocytosis, colitis, prolonged PT, hemorrhage, superinfection

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose; with prolonged therapy, monitor renal, hepatic, and hematologic function periodically

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, nephrotoxicity). Assess results of laboratory tests, therapeutic response, and adverse effects (eg, hemolytic anemia, hypoprothrombinemia, and bleeding) regularly during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, opportunistic infection, hypersensitivity reaction).

Monitoring: Lab TestsRenal, hepatic, and hematologic function periodically with prolonged therapy; perform culture and sensitivity studies prior to initiating drug therapy

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at regular intervals around-the-clock (take capsules with or without food; take suspension 2 hours before or 1 hour after meals). Chilling oral suspension improves flavor (do not freeze). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Complete full course of medication, even if you feel better. May cause false test results with Clinitest®; use of another type of testing is preferable. May cause headache or dizziness (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Cedax®: 400 mg

Powder for oral suspension:

Cedax®: 90 mg/5 mL (30 mL, 60 mL, 90 mL, 120 mL) [contains sucrose 1g/5 mL and sodium benzoate; cherry flavor]

Generic AvailableNo

ManufacturerSchering-Plough Corp

Pricing: U.S. (www.drugstore.com)

Capsules (Cedax)

400 mg (20): $286.85

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: Rapid; food decreases peak concentrations, delays T_{max}, and lowers AUC

Distribution: V_d: Children: 0.5 L/kg; Adults: 0.21 L/kg

Protein binding: 65%

Half-life elimination: 2 hours

Time to peak: 2-3 hours

Excretion: Urine (52%); feces (39%)

Related Information

Ceftizoxime

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ceftizoxime may be confused with cefotaxime, ceftazidime, cefuroxime

Pronunciation(sef ti ZOKS eem)

U.S. Brand NamesCefizox®

Canadian Brand NamesCefizox®

Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)

Use: Labeled IndicationsTreatment of susceptible bacterial infections, mainly respiratory tract, skin and skin structure, bone and joint, urinary tract and gynecologic, as well as septicemia; active against many gram-negative bacilli (not *Pseudomonas*), some gram-positive cocci (not *Enterococcus*), and some anaerobes

Dosing: Adults**Usual dosage:** I.M., I.V.: 1-2 g every 8-12 hours, up to 2 g every 4 hours or 4 g every 8 hours for life-threatening infections

Gonococcal:

Disseminated infection: I.M., I.V.: 1 g every 8 hours

Uncomplicated: I.M.: 1 g as single dose

Life-threatening infections: I.V.: 2 g every 4 hours or 4 g every 8 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricUsual dosage: I.M., I.V.: Children ≥6 months: 150-200 mg/kg/day divided every 6-8 hours (maximum: 12 g/24 hours)

Dosing: Renal Impairment

Cl_{cr} 50-79 mL/minute: Administer 500-1500 mg every 8 hours.

Cl_{cr} 5-49 mL/minute: Administer 250-1000 mg every 12 hours.

Cl_{cr} 0-4 mL/minute: Administer 500-1000 mg every 48 hours or 250-500 mg every 24 hours.

Moderately dialyzable (20% to 50%)

Continuous arteriovenous hemofiltration: Dose as for Cl_{cr} 10-50 mL/minute.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.

Administration: I.V.Inject direct I.V. over 3-5 minutes. Infuse intermittent infusion over 30 minutes.

Administration: I.V. DetailpH: 6-8 (reconstituted solution); 5.5-8.0 (frozen premixed infusion solution)

Dietary ConsiderationsSodium content of 1 g: 60 mg (2.6 mEq)

StorageReconstituted solution is stable for 24 hours at room temperature and 96 hours when refrigerated. For I.V. infusion in NS or D_5W, solution is stable for 24 hours at room temperature, 96 hours when refrigerated, or 12 weeks when frozen. After freezing, thawed solution is stable for 24 hours at room temperature or 10 days when refrigerated.

CompatibilityStable in $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, NS, sodium bicarbonate 5%.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, hydromorphone, labetalol, linezolid, melphalan, meperidine, morphine, ondansetron, propofol, ranitidine, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Filgrastim. **Variable (consult detailed reference):** Cisatracurium, promethazine, vancomycin.

Compatibility when admixed: Compatible: Clindamycin, metronidazole.

ContraindicationsHypersensitivity to ceftizoxime, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric ConsiderationsAdjust dose for renal function in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects have not been observed in animal studies; therefore, ceftizoxime is classified as pregnancy category B. Ceftizoxime crosses the placenta and is found in the cord blood and amniotic fluid in amounts that are higher than the maternal serum. The maternal peak concentrations at term are similar to those in nonpregnant volunteers.

LactationEnters breast milk (small amounts)/use caution

Breast-Feeding ConsiderationsVery small amounts of ceftizoxime are excreted in breast milk. The manufacturer recommends that caution be exercised when administering ceftizoxime to nursing women. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Ceftizoxime in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Fever

Dermatologic: Rash, pruritus

Hematologic: Eosinophilia, thrombocytosis

Hepatic: Alkaline phosphatase increased, transaminases increased

Local: Pain, burning at injection site

<1%: Anaphylaxis, diarrhea, nausea, vomiting, injection site reactions, phlebitis, paresthesia, numbness, bilirubin increased, BUN increased, creatinine increased, anemia, leukopenia, neutropenia, thrombocytopenia, vaginitis

Reactions reported with other cephalosporins: Stevens-Johnson syndrome, toxic epidermal necrolysis, erythema multiforme, pseudomembranous colitis, angioedema, hemolytic anemia, candidiasis, encephalopathy, asterixis, neuromuscular excitability, seizure, serum-sickness reactions, renal dysfunction, interstitial nephritis, toxic nephropathy, cholestasis, aplastic anemia, hemolytic anemia, pancytopenia, agranulocytosis, colitis, prolonged PT, hemorrhage, superinfection

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests (prothrombin times), therapeutic response, and adverse effects (eg, hemolytic anemia, hypoprothrombinemia, and bleeding) regularly during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, opportunistic infection, hypersensitivity reactions).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy; renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication is administered by infusion or injection. Report immediately any redness, swelling, burning, or pain at injection/infusion site; itching or hives; or difficulty swallowing or breathing. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed iso-osmotic solution]:

Canadian Brand NamesZeftera™

Pharmacologic CategoryAntibiotic, Cephalosporin

Use: Labeled IndicationsTreatment of complicated skin and skin structure infections, including diabetic foot infections without concurrent osteomyelitis, caused by *Enterobacter cloacae, Escherichia coli, Klebsiella pneumoniae, Proteus mirabilis, Staphylococcus aureus* (including methicillin resistant staphylococcus aureus [MRSA]) and *Streptococcus pyogenes*

Dosing: Adults

Usual dosage range: I.V.: 500 mg every 8-12 hours

Indication specific dosing:

Complicated skin and skin structure infections (not including diabetic foot infections): I.V.:

Gram positive: 500 mg every 12 hours for 7-14 days

Gram negative or mixed infection: 500 mg every 8 hours for 7-14 days

Complicated skin and skin structure infections including diabetic foot infections (nonlimb-threatening and without concurrent osteomyelitis): I.V.: *Gram positive, gram negative, and mixed infection:* 500 mg every 8 hours for 7-14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild impairment (Cl_{cr} 50-80 mL/minute): No adjustment necessary.

Moderate renal impairment (Cl_{cr} 30 to <50 mL/minute): 500 mg every 12 hours

Severe renal impairment:

Cl_{cr} <30 mL/minute: 250 mg every 12 hours

Cl_{cr} <10 mL/minute: Use has not been studied.

Dosing: Hepatic ImpairmentNo dosage adjustment is necessary.

Calculations

- Creatinine Clearance: Adults

Administration: I.V.Administer by I.V. infusion over 1 hour for gram-positive infections (without diabetic foot infections). Administer over 2 hours for gram-positive infections (with diabetic foot infections) and gram-negative/mixed (gram-positive and gram-negative) infections (with or without diabetic foot infections). Infuse over 2 hours in moderate-to-severe renal impairment, regardless of indication. Parenteral admixture does not need protected from light during infusion.

Administration: I.V. DetailpH: 4.52

StorageStore vials at 2°C to 8°C (36°F to 46°F); protect from light. After reconstitution with 10 mL diluent SWFI or D_5W, resulting solution is stable for 1 hour at 25°C (77°F) or 24 hours at 2°C to 8°C. Do not freeze vials (before or after reconstitution) or admixtures.

Admixture stability:

25°C (77°F): NS or LR: 24 hours if protected from light and 12 hours if not protected from light; D_5W: 8 hours irrespective of light exposure

2°C to 8°C (36°F to 46°F): NS or D_5W: 4 days if protected from light; LR: Do not refrigerate

Reconstitution

Reconstitute vial with 10 mL of diluent (SWFI or D_5W) to obtain a concentration of 50 mg/mL. Shake vial vigorously until total dissolution of powder. After reconstitution of powder, further dilution into 250 mL (125 mL if severe renal impairment) of NS, LR, or D_5W is required.

CompatibilityStable in D_5W, NS, LR, SWFI

Y-site administration: Compatible: Aminophylline, azithromycin, bumetanide, clindamycin, cyclosporine, dexamethasone, digoxin, doripenem, drotrecogin alfa, enalaprilat, fentanyl, fluconazole, furosemide, granisetron, heparin, hydrocortisone sodium succinate, lorazepam, mannitol, methylprednisolone sodium succinate, metoprolol, metronidazole, multivitamins, norepinephrine, potassium chloride, propofol, ranitidine, sodium bicarbonate, sulfamethoxazole-trimethoprim, vasopressin, voriconazole. **Incompatible:** Amikacin, amiodarone, amphotericin B (colloidal), calcium gluconate, caspofungin, ciprofloxacin, cisatracurium, diazepam, diltiazem, diphenhydramine, dobutamine, dopamine, famotidine, filgrastim, gentamicin, haloperidol, hydromorphone, hydroxyzine, insulin (regular), labetalol, levofloxacin, lidocaine, magnesium sulfate, meperidine, metoclopramide, midazolam, morphine, moxifloxacin, ondansetron, potassium phosphate, promethazine, tobramycin. **Variable (consult detailed reference):** Acyclovir, esomeprazole, insulin (lispro), milrinone, pantoprazole, remifentanil, sodium phosphate.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to ceftobiprole, any component of the formulation, or other cephalosporins; demonstrated anaphylaxis to beta-lactams

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hyponatremia: Hyponatremia has been observed in clinical trials; use with caution in patients at risk for hyponatremia (eg, primary adrenal insufficiency, syndrome of inappropriate antidiuretic hormone [SIADH]); monitor sodium levels during therapy.

- Hypersensitivity: Anaphylaxis has been reported with use; individuals with prior hypersensitivity reactions to other cephalosporins, beta-lactams, or multiple allergens are more likely to be at risk; discontinue use immediately with onset of signs/symptoms of allergic reaction.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment is required in moderate-to-severe impairment (Cl_{cr} 10 to <50 mL/minute). Use in end-stage renal disease (ESRD) (Cl_{cr} <10 mL/minute) has not been studied.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizure activity associated with use has most commonly been observed in this patient population; high levels of ceftobiprole, particularly in the presence of renal impairment, may increase risk of seizures.

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

Other warnings/precautions:

- Appropriate use: Use in immunosuppressed patients or patients with necrotizing fasciitis, gas gangrene, eczema, neutropenia, or neoplasia has not been evaluated and is not recommended. The 12-hour dosing interval in the treatment of diabetic foot infections has not been evaluated and is not recommended

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Use has not been studied in pregnant women.

LactationExcretion into breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Headache (5%), dizziness (3%), chills (≤1%), fatigue (≤1%), fever (≤1%)

Dermatologic: Rash (3%), pruritus (2%)

Endocrine & metabolic: Hyponatremia (1%)

Gastrointestinal: Nausea (9%), taste disturbance (6%), diarrhea (5%), vomiting (5%), constipation (1%), dyspepsia (≤1%)

Hepatic: ALT increased (≤2%), AST increased (≤1%)

Local: Phlebitis (2%)

<1%, postmarketing, and/or case reports: Abdominal pain, agitation, allergic dermatitis, anaphylactic shock, anaphylaxis, anemia, anxiety, back pain, basophilia, catheter site phlebitis, CDAD, creatinine increased, creatinine clearance decreased, dyspnea, eosinophilia, erythema, extremity pain, fungal infection, GGT increased, hot flush, hyperglycemia, hyperhidrosis, hypersensitivity, hypertension, triglycerides increased, infusion site reactions (pain, phlebitis), insomnia, LDH increased, maculopapular rash, muscle spasms, peripheral edema, pharyngeal pain, pollakiuria, seizures, somnolence, stomach discomfort, thrombocytosis, thrombophlebitis, urine odor abnormal, urticaria, vulvovaginal fungal infection, weakness, xerostomia

Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Monitoring ParametersSigns/symptoms of anaphylaxis/allergic or hypersensitivity reactions; BUN, creatinine, CBC, basic metabolic panel (BMP), culture and sensitivity

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests, patient's allergy history, and appropriateness for therapy prior to treatment. Use with caution in presence of renal impairment (dosage adjustment may be necessary). Note specific directions for reconstitution, compatibility, and administration. Patient should be monitored closely for hypersensitivity reactions. Evaluate results of laboratory tests, therapeutic response (according to indication for use), and adverse effects regularly during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsBUN, creatinine, CBC, basic metabolic panel (BMP), culture and sensitivity

Patient EducationThis medication can only be administered by infusion. Report immediately any pain, burning, or swelling at infusion site or any signs of allergic reaction (eg, respiratory difficulty or swallowing, back pain, chest tightness, rash, hives, swelling of lips or mouth). Report unusual headache, dizziness, chills, fever, gastrointestinal upset (nausea, vomiting, abdominal pain, or diarrhea), or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage Forms[CAN] = Canadian product

Injection, powder for reconstitution:

Zeftera™ [CAN]: 500 mg [not available in U.S.]

Generic AvailableNo

ManufacturerJanssen-Ortho, Inc

Mechanism of ActionProdrug converted in vivo to active drug with bactericidal activity; Inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs), including PBP2a on methicillin resistant staphylococcus, which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: V_{dss}: 18 L

Protein binding: ~16% (concentration independent); primarily to albumin and alpha-1 acid glycoprotein

Metabolism: Ceftobiprole medocaril (prodrug) rapidly metabolized by plasma esterases to ceftobiprole (active drug) which undergoes minimal metabolism to an inactive metabolite

Half-life elimination: ~3 hours; increased with renal impairment

Excretion: Urine (83% as active drug, 5% as inactive metabolite, <1% as unchanged prodrug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste disturbances have been reported; xerostomia and changes in salivation have been reported in <1% of individuals (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsBAL5788; BAL9141; Ceftobiprole Medocaril

Special Alerts

Ceftriaxone: Health Canada Issues Warning Concerning Precipitation Risks Associated With Calcium-Containing Products - August, 2008

Health Canada has issued a warning to Canadian hospitals alerting them of the potential risk of precipitation between ceftriaxone and calcium-containing products when infused together intravenously. A similar warning was previously issued by the U.S. Food and Drug Administration (FDA) in 2007.

Additional information may be found at:

Canada: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/ceftriaxone_nth-aah-eng

U.S.: http://www.fda.gov/medwatch/safety/2007/safety07.htm#Rocephin

Medication Safety Issues

Sound-alike/look-alike issues:

Rocephin® may be confused with Roferon®

Pronunciation(sef trye AKS one)

U.S. Brand NamesRocephin®

Canadian Brand NamesRocephin®

Pharmacologic CategoryAntibiotic, Cephalosporin (Third Generation)

Use: Labeled IndicationsTreatment of lower respiratory tract infections, acute bacterial otitis media, skin and skin structure infections, bone and joint infections, intra-abdominal and urinary tract infections, pelvic inflammatory disease (PID), uncomplicated gonorrhea, bacterial septicemia, and meningitis; used in surgical prophylaxis

Use: Unlabeled/InvestigationalTreatment of chancroid, epididymitis, complicated gonococcal infections; sexually-transmitted diseases (STD); periorbital or buccal cellulitis; salmonellosis or shigellosis; atypical community-acquired pneumonia; epiglottitis, Lyme disease; used in chemoprophylaxis for high-risk contacts and persons with invasive meningococcal disease; sexual assault; typhoid fever, Whipple's disease

Use: DentalAlternative antibiotic for prevention of infective endocarditis when parenteral administration is needed. Individuals allergic to amoxicillin (penicillins) may receive ceftriaxone provided they have not had an immediate, local, or systemic IgE-mediated anaphylactic allergic reaction to penicillin.

Dosing: Adults

Dosage range: Usual dose: 1-2 g every 12-24 hours, depending on the type and severity of infection

Arthritis, septic (unlabeled use): I.V.: 1-2 g once daily

Brain abscess (unlabeled use): I.V.: 2 g every 12 hours with metronidazole

Cavernous sinus thrombosis (unlabeled use): I.V.: 2 g once daily with vancomycin or linezolid

Chancroid (unlabeled use): I.M.: 250 mg as single dose

Chemoprophylaxis for high-risk contacts and persons with invasive meningococcal disease (unlabeled use): I.M.: 250 mg in a single dose

Gonococcal infections:

Conjunctivitis, complicated (unlabeled use): I.M., I.V.: 1 g in a single dose

Disseminated (unlabeled use): I.M., I.V.: 1 g once daily for 7 days

Endocarditis (unlabeled use): I.M., I.V.: 1-2 g every 24 hours for at least 28 days

Epididymitis, acute (unlabeled use): I.M.: 250 mg in a single dose with doxycycline

Prostatitis (unlabeled use): I.M.: 125-250 mg in a single dose with doxycycline

Uncomplicated: I.M.: 125-250 mg in a single dose

Infective endocarditis: I.M., I.V.:

Native valve: 2 g once daily for 2-4 weeks; **Note:** If using 2-week regimen, concurrent gentamicin is recommended

Prosthetic valve: I.M., I.V.: 2 g once daily for 6 weeks (with or without 2 weeks of gentamicin [dependent on penicillin MIC]); **Note:** For HACEK organisms, duration of therapy is 4 weeks

Enterococcus faecalis (resistant to penicillin, aminoglycoside, and vancomycin), native or prosthetic valve: 2 g twice daily for ≥8 weeks administered concurrently with ampicillin

Prophylaxis: I.M., I.V.: 1 g 30-60 minutes before procedure. Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications.

Note: American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Lyme disease (unlabeled use): I.V.: 2 g once daily for 14-28 days

Mastoiditis (hospitalized; unlabeled use): I.V.: 2 g once daily; >60 years old: 1 g once daily

Meningitis: I.V.: 2 g every 12 hours for 7-14 days (longer courses may be necessary for selected organisms

Orbital cellulitis (unlabeled use) and endophthalmitis: I.V.: 2 g once daily

PID: I.M.: 250 mg in a single dose

Pneumonia, community-acquired: I.V.: 1 g once daily, usually in combination with a macrolide; consider 2 g/day for patients at risk for more severe infection and/or resistant organisms (ICU status, age >65 years, disseminated infection)

Septic/toxic shock/necrotizing fasciitis (unlabeled use): I.V.: 2 g once daily; with clindamycin for toxic shock

STD prophylaxis in sexual assault victims: I.M.: 125 mg as a single dose

Surgical prophylaxis: I.V.: 1 g 30 minutes to 2 hours before surgery

Syphilis (unlabeled use): I.M., I.V.: 1 g once daily for 8-10 days

Typhoid fever (unlabeled use): I.V.: 2 g once daily for 14 days

Whipple's disease (unlabeled use): Initial: 2 g once daily for 10-14 days, then oral therapy for ~ 1 year.

⇧ Dosing: ElderlyRefer to adult dosing.
⇧ Dosing: Pediatric

Dosage range: Infants and Children: Usual dose: I.M., I.V.:

Mild-to-moderate infections: 50-75 mg/kg/day in 1-2 divided doses every 12-24 hours (maximum: 2 g/day); continue until at least 2 days after signs and symptoms of infection have resolved

Serious infections: 80-100 mg/kg/day in 1-2 divided doses (maximum: 4 g/day)

Epiglottis (unlabeled use): I.M., I.V.: 50-100 mg/kg once daily; reported duration of treatment ranged from 2-14 days

Gonococcal infections:

Conjunctivitis, complicated (unlabeled use): I.M.:

<45 kg: 50 mg/kg in a single dose (maximum: 1 g)

≥45 kg: 1 g in a single dose

Disseminated (unlabeled use): I.M., I.V.:

<45 kg: 25-50 mg/kg once daily (maximum: 1 g)

≥45 kg: 1 g once daily for 7 days

Endocarditis (unlabeled use):

<45 kg: I.M., I.V.: 50 mg/kg/day every 12 hours (maximum: 2 g/day) for at least 28 days

≥45 kg: I.V.: 1-2 g every 12 hours, for at least 28 days

Prophylaxis (due to maternal gonococcal infection): I.M., I.V.: 25-50 mg/kg as a single dose (maximum: 125 mg)

Uncomplicated: I.M.: 125 mg in a single dose

Infective endocarditis: I.M., I.V.:

Native valve: 100 mg/kg once daily for 2-4 weeks; **Note:** If using 2-week regimen, concurrent gentamicin is recommended

Prosthetic valve: 100 mg/kg once daily for 6 weeks (with or without 2 weeks of gentamicin [dependent on penicillin MIC]); **Note:** For HACEK organisms, duration of therapy is 4 weeks

Enterococcus faecalis (resistant to penicillin, aminoglycoside, and vancomycin), native or prosthetic valve: 100 mg/kg once daily for ≥8 weeks administered concurrently with ampicillin

Prophylaxis: 50 mg/kg 30-60 minutes before procedure; maximum dose: 1 g. Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications.

Note: American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Lyme disease, persistent arthritis (unlabeled use): I.M., I.V.: 75-100 mg/kg (maximum: 2 g) for 2-4 weeks

Meningitis: I.M., I.V.:

Uncomplicated: Loading dose of 100 mg/kg (maximum: 4 g), followed by 100 mg/kg/day divided every 12-24 hours (maximum: 4 g/day); usual duration of treatment is 7-14 days

Gonococcal, complicated:

<45 kg: 50 mg/kg/day given every 12 hours (maximum: 2 g/day); usual duration of treatment is 10-14 days

>45 kg: I.V.: 1-2 g every 12 hours; usual duration of treatment is 10-14 days

Otitis media: I.M.:

Acute: 50 mg/kg in a single dose (maximum: 1 g)

Persistent or relapsing (unlabeled use): 50 mg/kg once daily for 3 days

Pneumonia: I.V.: 50-75 mg/kg once daily

Skin/skin structure infections: I.M., I.V.: 50-75 mg/kg/day in 1-2 divided doses (maximum: 2 g/day)

STD, sexual assault (unlabeled uses): 125 mg in a single dose

Typhoid fever (unlabeled use): I.V.: 75-80 mg/kg once daily for 5-14 days

Chemoprophylaxis for high-risk contacts and persons with invasive meningococcal disease (unlabeled use):

Children ≤15 years: I.M.: 125 mg in a single dose

Children >15 years: Refer to adult dosing.

Epididymitis, acute: Children >8 years (≥45 kg) and Adolescents (unlabeled use): I.M.: 125 mg in a single dose

Dosing: Renal Impairment

No adjustment is generally necessary; if severe impairment, particularly with concurrent hepatic dysfunction, do not exceed 2 g/day without serum concentration monitoring.

Not dialyzable (0% to 5%)

Administer dose postdialysis.

Continuous ambulatory peritoneal dialysis (CAPD): Administer 1 g every 12 hours

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH or CVVHD/CVVHDF: 2 g every 12-24 hours

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: I.M.Inject deep I.M. into large muscle mass; a concentration of 250 mg/mL or 350 mg/mL is recommended for all vial sizes except the 250 mg size (250 mg/mL is suggested); can be diluted with 1:1 water and 1% lidocaine for I.M. administration.

Administration: I.V.Refer to Compatibility. Do not reconstitute or coadminister with calcium-containing solutions. Infuse intermittent infusion over 30 minutes.

Administration: I.V. DetailpH: 6.6 (premixed infusion solution); 6.7 (1% aqueous solution)

Dietary ConsiderationsSodium contents: ~83 mg (3.6 mEq) per ceftriaxone 1 g

Storage

Powder for injection: Prior to reconstitution, store at room temperature ≤25°C (≤77°F). Protect from light.

Premixed solution (manufacturer premixed): Store at -20°C; once thawed, solutions are stable for 3 days at room temperature of 25°C (77°F) or for 21 days refrigerated at 5°C (41°F). Do not refreeze.

Stability of reconstituted solutions:

10-40 mg/mL: Reconstituted in D_5W, $D_{10}W$, NS, or SWFI: Stable for 2 days at room temperature of 25°C (77°F) or for 10 days when refrigerated at 4°C (39°F). Stable for 26 weeks when frozen at -20°C when reconstituted with D_5W or NS. Once thawed (at room temperature), solutions are stable for 2 days at room temperature of 25°C (77°F) or for 10 days when refrigerated at 4°C (39°F); does not apply to manufacturer's premixed bags. Do not refreeze.

100 mg/mL:

Reconstituted in D$_5$W, SWFI, or NS: Stable for 2 days at room temperature of 25°C (77°F) or for 10 days when refrigerated at 4°C (39°F).

Reconstituted in lidocaine 1% solution or bacteriostatic water: Stable for 24 hours at room temperature of 25°C (77°F) or for 10 days when refrigerated at 4°C (39°F).

250-350 mg/mL: Reconstituted in D$_5$W, NS, lidocaine 1% solution, bacteriostatic water, or SWFI: Stable for 24 hours at room temperature of 25°C (77°F) or for 3 days when refrigerated at 4°C (39°F).

Reconstitution

I.M. injection: Vials should be reconstituted with appropriate volume of diluent (including D$_5$W, NS, SWFI, bacteriostatic water, or 1% lidocaine) to make a final concentration of 250 mg/mL or 350 mg/mL.

Volume to add to create a **250 mg/mL** solution:

250 mg vial: 0.9 mL

500 mg vial: 1.8 mL

1 g vial: 3.6 mL

2 g vial: 7.2 mL

Volume to add to create a **350 mg/mL** solution:

500 mg vial: 1.0 mL

1 g vial: 2.1 mL

2 g vial: 4.2 mL

I.V. infusion: Infusion is prepared in two stages: Initial reconstitution of powder, followed by dilution to final infusion solution.

Vials: Reconstitute powder with appropriate I.V. diluent (including SWFI, D$_5$W, D$_{10}$W, NS) to create an initial solution of ~100 mg/mL. Recommended volume to add:

250 mg vial: 2.4 mL

500 mg vial: 4.8 mL

1 g vial: 9.6 mL

2 g vial: 19.2 mL

Note: After reconstitution of powder, further dilution into a volume of compatible solution (eg, 50-100 mL of D$_5$W or NS) is recommended.

Piggyback bottle: Reconstitute powder with appropriate I.V. diluent (D$_5$W or NS) to create a resulting solution of ~100 mg/mL. Recommended initial volume to add:

1 g bottle:10 mL

2 g bottle: 20 mL

Note: After reconstitution, to prepare the final infusion solution, further dilution to 50 mL or 100 mL volumes with the appropriate I.V. diluent (including D$_5$W or NS) is recommended.

CompatibilityStable in D$_5$W with KCl 10 mEq, D$_5{}^1/_4$NS with KCl 20 mEq, D$_5{}^1/_2$ NS, D$_5$W, D$_{10}$W, NS, mannitol 5%, mannitol 10%, sodium bicarbonate 5%, bacteriostatic water, sterile water for injection. **Incompatible** with calcium-containing solutions (eg, LR, Hartmann's solution, parenteral nutrition solutions). **Variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, amiodarone, anidulafungin, aztreonam, bivalirudin, cisatracurium, daptomycin, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, drotrecogin alfa, etoposide phosphate, famotidine, fenoldopam, fludarabine, foscarnet, gallium nitrate, gatifloxacin, gemcitabine, granisetron, heparin, lansoprazole, linezolid, melphalan, meperidine, methotrexate, morphine, paclitaxel, pantoprazole, pemetrexed, propofol, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, warfarin, zidovudine. **Incompatible:** Alatrofloxacin, amphotericin B cholesteryl sulfate complex, amsacrine, azithromycin, calcium, filgrastim, fluconazole, Hartmann's solution, labetalol, LR, pentamidine, parenteral nutrition solutions (containing calcium), vinorelbine. **Variable (consult detailed reference):** Anakinra, vancomycin.

Compatibility in syringe: Variable (consult detailed reference): Lidocaine.

Compatibility when admixed: Compatible: Amikacin, metronidazole. **Incompatible:** Aminophylline, amsacrine, calcium, clindamycin, fluconazole, linezolid, theophylline. **Variable (consult detailed reference):** Gentamicin, metronidazole hydrochloride, vancomycin.

ContraindicationsHypersensitivity to ceftriaxone sodium, any component of the formulation, or other cephalosporins; **do not use in hyperbilirubinemic neonates**, particularly those who are premature since ceftriaxone is reported to displace bilirubin from albumin binding sites; concomitant use with intravenous calcium-containing solutions/products in neonates (≤28 days)

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Elevated INR: May be associated with increased INR (rarely), especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.
- Pancreatitis: Secondary to biliary obstruction, pancreatitis has been reported rarely.
- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Gallbladder disease: Abnormal gallbladder sonograms have been reported, possibly due to ceftriaxone-calcium precipitates; discontinue in patients with signs and symptoms of gallbladder disease.
- Gastrointestinal disease: Use with caution in patients with a history of GI disease, especially colitis.
- Renal impairment: No adjustment is generally necessary in patients with renal impairment; if severe renal impairment, particularly with concurrent hepatic dysfunction, do not exceed 2 g/day without serum concentration monitoring.

Special populations:

- Neonates: Use extreme caution in neonates due to risk of hyperbilirubinemia, particularly in premature infants (contraindicated in hyperbilirubinemic neonates). Fatal precipitation reactions in neonates due to coadministration of calcium-containing solutions have been reported; concurrent use in neonates is contraindicated.

Other warnings/precautions:

- Precipitation: Ceftriaxone may complex with calcium causing precipitation. Fatal lung and kidney damage associated with calcium-ceftriaxone precipitates has been observed in premature and term neonates. Due to reports of precipitation reaction in neonates, do not reconstitute, admix, or coadminister with calcium-containing solutions (eg, LR, Hartmann's solution, parenteral nutrition), even via separate infusion lines/sites or at different times in any patient, regardless of age (contraindicated in neonates). Recommendations further state to avoid administration of intravenous calcium-containing solutions and ceftriaxone within 48 hours of each other in all patients. However, extending these recommendations to all patients is based solely on theoretical data, as there have been no reports of precipitant-induced adverse effects in non-neonatal patients.

Geriatric ConsiderationsNo adjustment for changes in renal function necessary.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects have not been observed in animal studies; therefore, ceftriaxone is classified as pregnancy category B. The pharmacokinetics of ceftriaxone in the third trimester are similar to those of nonpregnant patients, with the possible exception of lower peak concentrations during labor. Ceftriaxone crosses the placenta and distributes to amniotic fluid. Ceftriaxone is recommended for use in pregnant women for the treatment of gonococcal infections.

LactationEnters breast milk/use caution (AAP rates "compatible")

Breast-Feeding ConsiderationsSmall amounts of ceftriaxone are excreted in breast milk. The manufacturer recommends that caution be exercised when administering ceftriaxone to nursing women. The American Academy of Pediatrics considers ceftriaxone to be "usually compatible with breast-feeding." Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- CefTRIAXone in Pregnancy & Lactation

Adverse Reactions

>10%: Local: Induration (I.M. 5% to 17%), warmth (I.M.), tightness (I.M.)

1% to 10%:

Dermatologic: Rash (2%)

Gastrointestinal: Diarrhea (3%)

Hematologic: Eosinophilia (6%), thrombocytosis (5%), leukopenia (2%)

Hepatic: Transaminases increased (3%)

Local: Tenderness at injection site (I.V. 1%), pain

Renal: BUN increased (1%)

<1%: Abdominal pain, agranulocytosis, alkaline phosphatase increased, allergic pneumonitis, anaphylaxis, anemia, basophilia, biliary lithiasis, bilirubin increased, bronchospasm, chills, colitis, creatinine increased, diaphoresis, dizziness, dysgeusia, dyspepsia, epistaxis, fever, flatulence, flushing, gallbladder sludge, gallstones, glycosuria, headache, hematuria, hemolytic anemia, jaundice, leukocytosis, lymphocytosis, lymphopenia, monocytosis, moniliasis, nausea, nephrolithiasis, neutropenia, palpitation, pancreatitis, phlebitis, prolonged or decreased PT, pruritus, pseudomembranous colitis, seizure, serum sickness, thrombocytopenia, urinary casts, vaginitis, vomiting

Postmarketing and/or case reports: Allergic dermatitis, edema, erythema multiforme, exanthema, glossitis, Lyell's syndrome, oliguria, renal and pulmonary ceftriaxone-calcium precipitations (neonates; including some fatalities), Stevens-Johnson syndrome, stomatitis, toxic epidermal necrolysis, urticaria

Reactions reported with other cephalosporins: Angioedema, allergic reaction, aplastic anemia, asterixis, cholestasis, encephalopathy, hemorrhage, hepatic dysfunction, hyperactivity (reversible), hypertonia, interstitial nephritis, LDH increased, neuromuscular excitability, pancytopenia, paresthesia, renal dysfunction, superinfection, toxic nephropathy

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Calcium Salts (Intravenous): May enhance the adverse/toxic effect of CefTRIAXone. Ceftriaxone binds to calcium forming an insoluble precipitate. *Risk X: Avoid combination*

Ringer's Injection (Lactated): May enhance the adverse/toxic effect of CefTRIAXone. Ceftriaxone binds to calcium in the Lactated Ringer's forming an insoluble precipitate. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Cephalosporins may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction

Monitoring ParametersObserve for signs and symptoms of anaphylaxis

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (eg, coumarin derivatives, calcium-containing products). I.V.: Note specific directions for reconstitution, compatibility, and administration. Assess results of laboratory tests (prothrombin times), therapeutic response, and adverse effects regularly during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsProthrombin times; perform culture and sensitivity studies prior to initiating drug therapy.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. This medication can only be administered by injection or infusion. Report immediately any swelling, pain, burning, or redness at infusion/injection site; back pain; difficulty breathing or swallowing; rapid heartbeat; or chills. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, vaginal itching or drainage, unusual fever or chills); or CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Infusion [premixed in dextrose]: 1 g (50 mL); 2 g (50 mL)

Injection, powder for reconstitution: 250 mg, 500 mg, 1 g, 2 g, 10 g

Rocephin®: 250 mg [DSC], 500 mg, 1 g, 2 g [DSC], 10 g [contains sodium ~83 mg (3.6 mEq) per ceftriaxone 1 g] [DSC]

Generic AvailableYes

ManufacturerRoche Laboratories Inc

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: I.M.: Well absorbed

Distribution: V_d: 6-14 L; widely throughout the body including gallbladder, lungs, bone, bile, CSF (higher concentrations achieved when meninges are inflamed)

Protein binding: 85% to 95%

Half-life elimination: Normal renal and hepatic function: 5-9 hours; Renal impairment (mild-to-severe): 12-16 hours

Time to peak, serum: I.M.: 2-3 hours

Excretion: Urine (33% to 67% as unchanged drug); feces (as inactive drug)

Cefuroxime

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Cefuroxime may be confused with cefotaxime, cefprozil, ceftizoxime, deferoxamine

Ceftin® may be confused with Cefzil®, Cipro®

Zinacef® may be confused with Zithromax®

International issues:

Ceftin® may be confused with Cefiton® which is a brand name for cefixime in Portugal

Ceftin® may be confused with Ceftina® which is a brand name for cefalotin in Mexico

Ceftin® may be confused with Ceftim® which is a brand name for ceftazidime in Italy

Pronunciation(se fyoor OKS eem)

U.S. Brand NamesCeftin®; Zinacef®

Canadian Brand NamesApo-Cefuroxime®; Ceftin®; Cefuroxime For Injection; Pro-Cefuroxime; Ratio-Cefuroxime; Zinacef®

Pharmacologic CategoryAntibiotic, Cephalosporin (Second Generation)

Use: Labeled IndicationsTreatment of infections caused by staphylococci, group B streptococci, *H. influenzae* (type A and B), *E. coli*, *Enterobacter*, *Salmonella*, and *Klebsiella*; treatment of susceptible infections of the upper and lower respiratory tract, otitis media, urinary tract, uncomplicated skin and soft tissue, bone and joint, sepsis, uncomplicated gonorrhea, and early Lyme disease; preoperative prophylaxis of susceptible infections

Dosing: Adults**Note:** Cefuroxime axetil film-coated tablets and oral suspension are not bioequivalent and are not substitutable on a mg/mg basis. All oral doses listed are for tablet formulation:

Acute bacterial maxillary sinusitis: Oral: 250 mg twice daily for 10 days

Bronchitis, acute (and exacerbations of chronic bronchitis):

Oral: 250-500 mg every 12 hours for 10 days

I.V.: 500-750 mg every 8 hours (complete therapy with oral dosing)

Cellulitis, orbital: I.V.: 1.5 g every 8 hours

Gonorrhea:

Disseminated: I.M., I.V.: 750 mg every 8 hours

Uncomplicated:

Oral: 1 g as a single dose

I.M.: 1.5 g as single dose (administer in two different sites with probenecid)

Lyme disease (early): Oral: 500 mg twice daily for 20 days

Pharyngitis/tonsillitis and sinusitis: Oral: 250 mg twice daily for 10 days

Skin/skin structure infection, uncomplicated:

Oral: 250-500 mg every 12 hours for 10 days

I.M., I.V.: 750 mg every 8 hours

Pneumonia, uncomplicated: I.M., I.V.: 750 mg every 8 hours

Severe or complicated infections: I.M., I.V.: 1.5 g every 8 hours (up to 1.5 g every 6 hours in life-threatening infections)

Surgical prophylaxis:

I.V.: 1.5 g 30 minutes to 1 hour prior to procedure (if procedure is prolonged can give 750 mg every 8 hours I.M.)

Open heart: I.V.: 1.5 g every 12 hours to a total of 6 g

Urinary tract infection, uncomplicated:

Oral: 125-250 mg twice daily for 7-10 days

I.V., I.M.: 750 mg every 8 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Note:** Cefuroxime axetil film-coated tablets and oral suspension are not bioequivalent and are not substitutable on a mg/mg basis.

Children 3 months to 12 years:

Epiglottitis: 150 mg/kg/day in 3 divided doses for 7-10 days

Acute otitis media, impetigo:

Oral:

Suspension: 30 mg/kg/day (maximum: 1 g/day) in 2 divided doses

Tablet: 250 mg every 12 hours

I.M., I.V.: 75-150 mg/kg/day divided every 8 hours (maximum dose: 6 g/day)

Acute bacterial maxillary sinusitis: Oral:

Suspension: 30 mg/kg/day in 2 divided doses for 10 days (maximum dose: 1 g/day)

Tablet: 250 mg twice daily for 10 days

Meningitis: NOT recommended (doses of 200-240 mg/kg/day divided every 6-8 hours have been used) (maximum dose: 9 g/day)

Pharyngitis, tonsillitis:

Oral:

Suspension: 20 mg/kg/day (maximum: 500 mg/day) in 2 divided doses for 10 days

Tablet: 125 mg every 12 hours for 10 days

I.M., I.V.: 75-150 mg/kg/day divided every 8 hours; maximum dose: 6 g/day

Children ≥13 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 10-20 mL/minute: Administer every 12 hours.

Cl_{cr} <10 mL/minute: Administer every 24 hours.

Hemodialysis: Dialyzable (25%)

Peritoneal dialysis: Dose every 24 hours

Continuous renal replacement therapy (CRRT): 1 g every 12 hours

Note: Cefuroxime axetil film-coated tablets and oral suspension are not bioequivalent and are not substitutable on a mg/mg basis.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.
Administration: I.V.Inject direct I.V. over 3-5 minutes. Infuse intermittent infusion over 15-30 minutes.
Administration: I.V. DetailpH: 6.0-8.5 (vials); 5.0-7.5 (frozen premixed solution)
Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels. Oral suspension: Administer with food. Shake well before use.
Dietary ConsiderationsMay be taken with food.

Zinacef®: Sodium content: 1.8 mEq (41 mg) per 750 mg

Ceftin®: Powder for oral suspension 125 mg/5 mL contains phenylalanine 11.8 mg/5 mL; 250 mg/5 mL contains phenylalanine 25.2 mg/5 mL.

Storage

Injection: Reconstituted solution is stable for 24 hours at room temperature and 48 hours when refrigerated. I.V. infusion in NS or D_5W solution is stable for 24 hours at room temperature, 7 days when refrigerated, or 26 weeks when frozen. After freezing, thawed solution is stable for 24 hours at room temperature or 21 days when refrigerated.

Oral suspension: Prior to reconstitution, store at 2°C to 30°C (36°F to 86°F). Reconstituted suspension is stable for 10 days at 2°C to 8°C (36°F to

46°F).

Tablet: Store at 15°C to 30°C (59°F to 86°F).

CompatibilityStable in $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, NS.

Y-site administration: Compatible: Acyclovir, allopurinol, amifostine, atracurium, aztreonam, cyclophosphamide, diltiazem, docetaxel, etoposide, famotidine, fludarabine, foscarnet, gemcitabine, granisetron, hydromorphone, linezolid, melphalan, meperidine, morphine, ondansetron, pancuronium, perphenazine, propofol, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, vecuronium. **Incompatible:** Clarithromycin, filgrastim, fluconazole, midazolam, vinorelbine. **Variable (consult detailed reference):** Cisatracurium, vancomycin.

Compatibility in syringe: Incompatible: Doxapram.

Compatibility when admixed: Compatible: Clindamycin, floxacillin, furosemide, heparin, metronidazole, potassium chloride. **Incompatible:** Aminoglycosides, sodium bicarbonate. **Variable (consult detailed reference):** Gentamicin, ranitidine.

ContraindicationsHypersensitivity to cefuroxime, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Elevated INR: May be associated with increased INR, especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.
- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.
- Suspension/tablet bioequivalence: Tablets and oral suspension are not bioequivalent; do not substitute on a mg-per-mg basis.

Geriatric ConsiderationsAdjust dose for renal function in the elderly. Considered one of the drugs of choice for outpatient treatment of community-acquired pneumonia in the elderly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal studies; therefore, cefuroxime is classified as pregnancy category B. Cefuroxime crosses the placenta and reaches the cord serum and amniotic fluid. Placental transfer is decreased in the presence of oligohydraminios. Several studies have failed to identify a teratogenic risk to the fetus from maternal cefuroxime use.

During pregnancy, mean plasma concentrations of cefuroxime are 50% lower, the AUC is 25% lower, and the plasma half-life is shorter than nonpregnant values. At term, plasma half-life is similar to nonpregnant values and peak maternal concentrations after I.M. administration are slightly decreased. Pregnancy does not alter the volume of distribution.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsCefuroxime is excreted in breast milk. Manufacturer recommendations vary; caution is recommended if cefuroxime I.V. is given to a nursing woman and it is recommended to consider discontinuing nursing temporarily during treatment following oral cefuroxime. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cefuroxime in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (4% to 11%, duration-dependent)

1% to 10%:

Dermatologic: Diaper rash (3%)

Endocrine & metabolic: Alkaline phosphatase increased (2%), lactate dehydrogenase increased (1%)

Gastrointestinal: Nausea/vomiting (3% to 7%)

Genitourinary: Vaginitis (≤5%)

Hematologic: Eosinophilia (7%), hemoglobin and hematocrit decreased (10%)

Hepatic: Transaminases increased (2% to 4%)

Local: Thrombophlebitis (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Anaphylaxis, angioedema, BUN increased, chest pain, cholestasis, colitis, creatinine increased, dyspnea, erythema multiforme, fever, GI bleeding, hemolytic anemia, hepatitis, hives, hyperbilirubinemia, hypersensitivity, interstitial nephritis, jaundice, leukopenia, neutropenia, pain at injection site, pancytopenia, positive Coombs test, prolonged PT/INR, pseudomembranous colitis, rash, renal dysfunction, seizure, Stevens-Johnson syndrome, stomach cramps, tachycardia, thrombocytopenia (rare), tongue swelling, toxic epidermal necrolysis, urticaria

Reactions reported with other cephalosporins: Agranulocytosis, aplastic anemia, asterixis, encephalopathy, hemorrhage, neuromuscular excitability, serum-sickness reactions, superinfection, toxic nephropathy

Drug Interactions

Antacids: May decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

H2-Antagonists: May decrease the absorption of Cefuroxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Bioavailability is increased with food; cefuroxime serum levels may be increased if taken with food or dairy products.

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution); false-negative may occur with ferricyanide test. Glucose oxidase or hexokinase-based methods should be used.

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose; with prolonged therapy, monitor renal, hepatic, and hematologic function periodically; monitor prothrombin time in patients at risk of prolongation during cephalosporin therapy (nutritionally-deficient, prolonged treatment, renal or hepatic disease)

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, nephrotoxicity). Assess results of laboratory tests (prothrombin times), therapeutic response, and adverse reactions (eg, hemolytic anemia, hypoprothrombinemia, and bleeding) regularly during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, opportunistic infection, hypersensitivity reaction).

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating therapy; renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. If administered by injection or infusion, report immediately any swelling, redness, or pain at injection/infusion site; respiratory difficulty or swallowing; chest pain; or rash. Oral tablets or suspension should be taken as directed, at regular intervals around-the-clock (with or without food). Chilling oral suspension improves flavor (do not freeze); shake well before using. Complete full course of medication, even if you feel better. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength expressed as base

Infusion, as sodium [premixed]: 750 mg (50 mL); 1.5 g (50 mL)

Zinacef®: 750 mg (50 mL); 1.5 g (50 mL) [contains sodium 4.8 mEq (111 mg) per 750 mg]

Injection, powder for reconstitution, as sodium: 750 mg, 1.5 g, 7.5 g, 75 g, 225 g

Zinacef®: 750 mg, 1.5 g, 7.5 g [contains sodium 1.8 mEq (41 mg) per 750 mg]

Powder for suspension, oral, as axetil: 125 mg/5 mL (100 mL); 250 mg/5 mL (50 mL, 100 mL)

Ceftin®: 125 mg/5 mL (100 mL) [contains phenylalanine 11.8 mg/5 mL; tutti-frutti flavor]; 250 mg/5 mL (50 mL, 100 mL) [contains phenylalanine 25.2 mg/5 mL; tutti-frutti flavor]

Tablet, as axetil: 250 mg, 500 mg

Ceftin®: 250 mg, 500 mg

Generic AvailableYes

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (Cefuroxime Axetil)

250 mg/5 mL (100): $89.99

Tablets (Ceftin)

250 mg (20): $177.24

500 mg (20): $308.62

Tablets (Cefuroxime Axetil)

250 mg (20): $70.99

500 mg (20): $73.98

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: Oral (cefuroxime axetil): Increases with food

Distribution: Widely to body tissues and fluids; crosses blood-brain barrier; therapeutic concentrations achieved in CSF even when meninges are not inflamed

Protein binding: 33% to 50%

Bioavailability: Tablet: Fasting: 37%; Following food: 52%

Half-life elimination: Children 1-2 hours; Adults: 1-2 hours; prolonged with renal impairment

Time to peak, serum: I.M.: ~15-60 minutes; I.V.: 2-3 minutes; Oral: Children: 3-4 hours; Adults: 2-3 hours

Excretion: Urine (66% to 100% as unchanged drug)

Related Information

- Antimicrobial Drugs of Choice
- Cephalosporins by Generation
- Community-Acquired Pneumonia in Adults

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness; case reports of euphoria, delusion, illusions, and depersonalization with cephalosporins

Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine

Index TermsCefuroxime Axetil; Cefuroxime Sodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Celebrex® may be confused with Celexa®, cerebra, Cerebyx®

Pronunciation(se le KOKS ib)

U.S. Brand NamesCelebrex®

Canadian Brand NamesCelebrex®; GD-Celecoxib

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), COX-2 Selective

Use: Labeled IndicationsRelief of the signs and symptoms of osteoarthritis, ankylosing spondylitis, juvenile rheumatoid arthritis (JRA), and rheumatoid arthritis; management of acute pain; treatment of primary dysmenorrhea; to reduce the number of intestinal polyps in familial adenomatous polyposis (FAP)

Canadian note: Celecoxib is only indicated for relief of symptoms of rheumatoid arthritis, osteoarthritis, and relief of acute pain in adults

Use: DentalManagement of acute dental pain

Dosing: Adults**Note:** Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals.

Osteoarthritis: Oral: 200 mg/day as a single dose or in divided dose twice daily

Ankylosing spondylitis: Oral: 200 mg/day as a single dose or in divided doses twice daily; if no effect after 6 weeks, may increase to 400 mg/day. If no response following 6 weeks of treatment with 400 mg/day, consider discontinuation and alternative treatment.

Rheumatoid arthritis: Oral: 100-200 mg twice daily

Familial adenomatous polyposis: Oral: 400 mg twice daily

Acute pain or primary dysmenorrhea: Oral: Initial dose: 400 mg, followed by an additional 200 mg if needed on day 1; maintenance dose: 200 mg twice daily as needed

Dosing: ElderlyRefer to adult dosing. No specific adjustment based on age is recommended. However, the AUC in elderly patients may be increased by 50% as compared to younger subjects. Initiate at the lowest recommended dose in patients weighing <50 kg.

Dosing: Pediatric**Note:** Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals.

JRA: Oral: Children ≥2 years:

≥10 kg to ≤25 kg: 50 mg twice daily

>25 kg: 100 mg twice daily

Dosing: Renal ImpairmentNo specific dosage adjustment is recommended. Not recommended in patients with severe renal dysfunction.

Dosing: Hepatic ImpairmentReduced dosage is recommended (AUC may be increased by 40% to 180%). Decrease dose by 50% in patients with moderate hepatic impairment (Child-Pugh class B). Not recommended for use with severe impairment.

Administration: OralLower doses (200 mg twice daily) may be taken without regard to meals. Larger doses should be taken with food to improve absorption. Capsules may be swallowed whole or the entire contents emptied onto a teaspoon of cool or room temperature applesauce. The contents of the capsules sprinkled onto applesauce may be stored under refrigeration for up to 6 hours.

Dietary ConsiderationsLower doses (200 mg twice daily) may be taken without regard to meals. Larger doses should be taken with food to improve absorption.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to celecoxib, sulfonamides, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass surgery (CABG); pregnancy (3rd trimester)

Canadian labeling: Additional contraindications (not in U.S. labeling): Pregnancy (3rd trimester); women who are breast-feeding; severe, uncontrolled heart failure; active gastrointestinal ulcer (gastric, duodenal, peptic) or bleeding; inflammatory bowel disease; cerebrovascular bleeding; severe liver impairment or active hepatic disease; severe renal impairment (Cl_{cr} <30 mL/minute) or deteriorating renal disease; known hyperkalemia; use in children

Allergy Considerations

- Celecoxib Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure, anaphylactic reactions and angioedema may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. May cause sodium and fluid retention, use with caution in patients with heart failure, edema or hypertension. Long-term cardiovascular risk in children has not been evaluated. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of rash.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.
- Coronary artery bypass surgery: **[U.S. Boxed Warning]: Celecoxib is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass surgery (CABG).** Risk of MI and stroke may be increased with use following CABG surgery.
- Cytochrome P450 isoenzyme 2C9 deficiency: Use with caution in patients with known or suspected deficiency of cytochrome P450 isoenzyme 2C9; poor metabolizers may have higher plasma levels due to reduced metabolism.
- Familial adenomatous polyposis (FAP): When used for the treatment of FAP, routine monitoring and care should be continued.
- Hepatic impairment: Use with caution in patients with moderate hepatic impairment; dosage adjustment recommended. Not recommended for patients with severe hepatic impairment. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, hepatic necrosis, jaundice, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.
- Renal impairment: NSAID use may compromise existing renal function. Dose-dependent decreases in prostaglandin synthesis may result from NSAID use, causing a reduction in renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics and ACEI, and the elderly are at greater risk for renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Pediatrics: When used for JRA, celecoxib is not FDA-approved in children <2 years of age or in children <10 kg. Use caution with systemic-onset JRA (may be at risk for disseminated intravascular coagulation). Safety and efficacy have not been established for use in children for indications other than JRA.

Geriatric ConsiderationsThe elderly are at increased risk for adverse effects from NSAIDs. As many as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically; however, elderly patients may demonstrate these adverse effects at lower doses than younger adults. The elderly are also at increased risk of renal toxicity. Although celecoxib is associated with a decreased incidence of GI side effects, use the lowest recommended dose in patients weighing <50 kg.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsTeratogenic effects were observed in animal studies. Avoid use in the 3rd trimester of pregnancy, this drug may cause premature closure of the ductus arteriosus.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsBased on limited data, celecoxib has been found to be excreted in milk; a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse Reactions

>10%:

Cardiovascular: Hypertension (≤13%)

Central nervous system: Headache (10% to 16%)

Gastrointestinal: Diarrhea (4% to 11%)

2% to 10%:

Cardiovascular: Peripheral edema (2%)

Central nervous system: Fever (≤9%), insomnia (2%), dizziness (1% to 2%)

Dermatologic: Skin rash (2%)

Gastrointestinal: Dyspepsia (9%), nausea (4% to 7%), gastroesophageal reflux (≤5%), abdominal pain (4% to 8%), vomiting (≤6%), flatulence (2%)

Neuromuscular & skeletal: Arthralgia (≤7%), back pain (3%)

Respiratory: Upper respiratory tract infection (8%), cough (≤7%), nasopharyngitis (≤6%), sinusitis (5%), dyspnea (≤3%), pharyngitis (2%), rhinitis (2%)

Miscellaneous: Accidental injury (3%)

0.1% to 2%:

Cardiovascular: Angina, aortic valve incompetence, chest pain, coronary artery disorder, DVT, edema, facial edema, hypertension (aggravated), MI, palpitation, sinus bradycardia, tachycardia, ventricular hypertrophy

Central nervous system: Anxiety, cerebral infarction, depression, fatigue, hypoesthesia, migraine, nervousness, pain, somnolence, vertigo

Dermatologic: Alopecia, bruising, cellulitis, dermatitis, dry skin, nail disorder, photosensitivity, pruritus, rash (erythematous), rash (maculopapular), urticaria

Endocrine & metabolic: Breast fibroadenosis, breast neoplasm, breast pain, diabetes mellitus, dysmenorrhea, hot flashes, hypercholesterolemia, hyperglycemia, hyper-/hypokalemia, hypernatremia, menstrual disturbances, ovarian cyst, testosterone decreased

Gastrointestinal: Anorexia, appetite increased, constipation, diverticulitis, dysphagia, eructation, esophagitis, gastritis, gastroenteritis, gastrointestinal ulcer, hemorrhoids, hiatal hernia, melena, stomatitis, taste disturbance, tenesmus, tooth disorder, weight gain, xerostomia

Genitourinary: Cystitis, dysuria, incontinence, monilial vaginitis, prostate disorder, urinary frequency, urinary tract infection, vaginal bleeding, vaginitis

Hematologic: Anemia, thrombocytopenia

Hepatic: Alkaline phosphatase increased, transaminases increased

Neuromuscular & skeletal: Arthrosis, bone disorder, CPK increased, fracture, leg cramps, myalgia, neck stiffness, neuralgia, neuropathy, paresthesia, hypertonia, synovitis, tendon rupture, tendonitis, weakness

Ocular: Blurred vision, cataract, conjunctival hemorrhage, conjunctivitis, eye pain, glaucoma, vitreous floaters

Otic: Deafness, earache, labyrinthitis, otitis media, tinnitus

Renal: Albuminuria, BUN increased, creatinine increased, hematuria, nonprotein nitrogen increased, renal calculi

Respiratory: Bronchitis, bronchospasm, epistaxis, laryngitis, pneumonia

Miscellaneous: Allergic reactions, allergy aggravated, diaphoresis, flu-like syndrome, herpes infection, infection (bacterial, fungal, viral), moniliasis

<0.1% (Limited to important or life-threatening): Acute renal failure, ataxia, cerebrovascular accident, CHF, cholelithiasis, colitis, esophageal perforation, gangrene, gastrointestinal bleeding, ileus, intestinal obstruction, intestinal perforation, pancreatitis, pulmonary embolism, sepsis, sudden death, suicide, syncope, thrombophlebitis, ventricular fibrillation

Postmarketing and/or case reports: Agranulocytosis, anaphylactoid reactions, angioedema, aplastic anemia, aseptic meningitis, erythema multiforme, exfoliative dermatitis, hepatic failure, hepatic necrosis, hepatitis (including fulminant), hypoglycemia, hyponatremia, interstitial nephritis, intracranial hemorrhage, jaundice, leukopenia, pancytopenia, renal papillary necrosis, Stevens-Johnson syndrome, toxic epidermal necrolysis, vasculitis

Metabolism/Transport Effects **Substrate** of CYP2C9 (major), 3A4 (minor); **Inhibits** CYP2C8 (moderate), 2D6 (weak)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (COX-2 Inhibitor) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (increased GI irritation).

Food: Peak concentrations are delayed and AUC is increased by 10% to 20% when taken with a high-fat meal.

Herb/Nutraceutical: Avoid concomitant use with herbs possessing anticoagulation/antiplatelet properties, including alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnuts, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow.

Monitoring ParametersCBC; blood chemistry profile; occult blood loss and periodic liver function tests; monitor renal function (urine output, serum BUN and creatinine; monitor response (pain, range of motion, grip strength, mobility, ADL function), inflammation; observe for weight gain, edema; observe for bleeding, bruising; evaluate gastrointestinal effects (abdominal pain, bleeding, dyspepsia); blood pressure

FAP: Continue routine endoscopic exams

JRA: Monitor for development of abnormal coagulation tests with systemic onset JRA

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking (ie, monitor patients taking lithium closely). Assess allergy history (aspirin, NSAIDs, salicylates). Monitor blood pressure at the beginning of therapy and periodically during use. Monitor effectiveness of therapy. Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.
Monitoring: Lab TestsCBC, blood chemistry profile, periodic liver function tests; renal function (urine output, serum BUN and creatinine)

FAP: Continue routine endoscopic exams

JRA: Monitor for development of abnormal coagulation tests with systemic onset JRA

Patient EducationDo not take more than recommended dose. May be taken with food to reduce GI upset. Do not take with antacids. Avoid alcohol, aspirin, and OTC medication unless approved by prescriber. You may experience dizziness, confusion, or blurred vision (avoid driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, taste disturbance, gastric distress (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). GI bleeding, ulceration, or perforation can occur with or without pain. It is unclear whether celecoxib has rates of these events which are similar to nonselective NSAIDs. Stop taking medication and report immediately stomach pain or cramping; unusual bleeding or bruising (blood in vomitus, stool, or urine); chest pain; shortness of breath; weakness of extremities; or slurring of speech. Report persistent insomnia; skin rash; unusual fatigue or flu-like symptoms; jaundice; muscle pain, tremors, or weakness; sudden weight gain or edema; changes in hearing (ringing in ears) or vision; changes in urination pattern; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform your prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Celebrex®: 50 mg, 100 mg, 200 mg, 400 mg

Generic AvailableNo
ManufacturerPfizer, Inc
Pricing: U.S. (www.drugstore.com)

Capsules (Celebrex)

100 mg (30): $75.99

200 mg (30): $120.91

400 mg (30): $176.00

Mechanism of Action Inhibits prostaglandin synthesis by decreasing the activity of the enzyme, cyclooxygenase-2 (COX-2), which results in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties
Pharmacodynamics/Kinetics

Distribution: V_d (apparent): ~400 L

Protein binding: ~97% primarily to albumin

Metabolism: Hepatic via CYP2C9; forms inactive metabolites

Bioavailability: Absolute: Unknown

Half-life elimination: ~11 hours (fasted)

Time to peak: ~3 hours

Excretion: Feces (57% as metabolites, <3% as unchanged drug); urine (27% as metabolites, <3% as unchanged drug)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Pharmacotherapy PearlsCelecoxib does not inhibit cyclooxygenase-1 (COX-1) at therapeutic concentrations. Celecoxib does not affect platelet aggregation.
Dental Health Professional ConsiderationsThe Food and Drug Administration (FDA) has announced product labeling changes for all NSAIDs, including COX-2 selective and over-the-counter (OTC) medications. These changes are the result of the Arthritis and Drug Safety and Risk Management Advisory Committee meeting held in February, 2005.

The FDA has asked that all labels be revised to include information related to the potential for increased risk of cardiovascular (CV) events and gastrointestinal (GI) bleeding associated with their use. In addition, prescription nonselective NSAIDs are being asked to add a contraindication for use in patients who have recently undergone coronary artery bypass graft (CABG) surgery and a boxed warning concerning the CV and GI events. Medication guides will be required for all prescription products. Manufacturers of OTC products are being asked to include a warning about potential skin reactions, which is already included in prescription labeling. The FDA will be working with manufacturers to conduct long-term clinical trials to assess the safety of these agents.

Pfizer, Inc, the manufacturer of celecoxib (Celebrex®) has reported an increased risk of cardiovascular events in one clinical trial during an interim analysis. The increased risk was observed in a trial evaluating celecoxib in patients at risk of colon cancer, prompting the National

Cancer Institute to end the study. Other similar clinical studies (which were subjected to analysis by data monitoring committees) are continuing, since an interim analysis of these trials did not reveal an increased risk of cardiovascular events. Further analysis of risk factors related to cardiovascular risk appear warranted. A notice posted by the Food and Drug Administration (FDA) states that the agency "will obtain all available data on these and other ongoing Celebrex® trials as soon as possible and will determine the appropriate regulatory action."

The FDA further notes that these new findings for celecoxib are similar to results with other drugs in this class. Increased cardiovascular risk noted in a study of rofecoxib (Vioxx®) led to a voluntary withdrawal of the product by Merck. In addition, another drug in this class, valdecoxib (Bextra®) demonstrated an increased risk for cardiovascular events in patients following cardiovascular surgery. Valdecoxib (Bextra®) was withdrawn from the market in May 2005.

In their statement, the FDA encourages physicians to consider this developing information in risk-to-benefit evaluations as they consider the use of celecoxib in individual patients. In addition, the FDA advises an evaluation of alternative therapy. If physicians determine that continued use is appropriate for individual patients, the lowest effective dose of celecoxib should be prescribed. Pfizer has not announced a decision to withdraw celecoxib from the market as of December 20, 2004.

The association between selective COX-2 inhibitors and increased cardiovascular risk has been noted previously and prompted by publication of a meta-analysis entitled "Risk of Cardiovascular Events Associated With Selective COX-2 Inhibitors" in the August 22, 2001, edition of the *Journal of the American Medical Association (JAMA)*. The researchers reanalyzed four previously published trials, assessing cardiovascular events in patients receiving either celecoxib or rofecoxib. They found an association between the use of COX-2 inhibitors and cardiovascular events (including MI and ischemic stroke). The annualized MI rate was found to be significantly higher in patients receiving celecoxib or rofecoxib than in the control (placebo) group from a recent meta-analysis of primary prevention trials. Although cause and effect cannot be established (these trials were originally designed to assess GI effects, not cardiovascular ones), the authors believe the available data raise a cautionary flag concerning the risk of cardiovascular events with the use of COX-2 inhibitors. The manufacturers of these agents, as well as other healthcare professionals, dispute the methods and validity of the study's conclusions. To date, the FDA has not required any change in the labeling of these agents. Further study is required before any potential risk may be defined.

Cross-reactivity, including bronchospasm, between aspirin and other NSAIDs has been reported in aspirin-sensitive patients. The manufacturer suggests that celecoxib should not be administered to patients with this type of aspirin sensitivity and should be used with caution in patients with pre-existing asthma.

The manufacturer studied the effect of celecoxib on the anticoagulant effect of warfarin and found no alteration of anticoagulant effect, as determined by prothrombin time, in patients taking 2 mg to 5 mg daily. However, the manufacturer has issued a caution when using celecoxib with warfarin since those patients are at increased risk of bleeding complications.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, abnormal taste, xerostomia (normal salivary flow resumes upon discontinuation), and tooth disorder. Nonselective NSAIDs are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. According to the manufacturer, celecoxib, at single doses up to 800 mg and multiple doses of 600 mg twice daily, had no effect on platelet aggregation or bleeding time. Comparative NSAIDs (naproxen 500 mg twice daily, ibuprofen 800 mg three times daily, or diclofenac 75 mg twice daily) significantly reduced platelet aggregation and prolonged the bleeding times. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness and insomnia; may rarely, cause anxiety, depression, nervousness, or somnolence

Mental Health: Effects on Psychiatric TreatmentEffects of benzodiazepines and antidepressants may be altered. Lithium concentrations may be increased by celecoxib via decreased renal lithium clearance; dose adjustment may be needed.

Cardiovascular ConsiderationsPfizer, Inc, the manufacturer of Celebrex® (celecoxib) has reported an increased risk of cardiovascular events in one clinical trial during an interim analysis. The increased risk was observed in a trial evaluating celecoxib in patients at risk of colon cancer, prompting the National Cancer Institute to end the study. Further analysis of risk factors related to cardiovascular risk appears warranted.

The FDA further notes that these new findings for celecoxib are similar to results with other drugs in this class. Increased cardiovascular risk noted in a study of rofecoxib (Vioxx®) led to a voluntary withdrawal of the product by Merck. In addition, another drug in this class, valdecoxib (Bextra®) demonstrated an increased risk for cardiovascular events in patients following cardiovascular surgery.

Physicians are encouraged to carefully evaluate individual cardiovascular risk profiles prior to prescribing COX-2 inhibitors. COX-2 inhibitors may be appropriate for patients who do not tolerate nonselective NSAIDs, those who are not doing well on NSAIDs, or those with a history of gastrointestinal bleeding. COX-2 inhibitors may not be appropriate in patients with cardiovascular disease or in patients with significant risk factors for cardiovascular disease. If physicians determine that continued use is appropriate for individual patients, the lowest effective dose of celecoxib should be prescribed for the shortest duration of treatment based upon goals.

Medication guides will be required for all prescription products.

Anesthesia and Critical Care Concerns/Other ConsiderationsCelecoxib does not inhibit platelets or prolong bleeding time.

Medication Safety Issues

Sound-alike/look-alike issues:

Surgicel® may be confused with Serentil®

Pronunciation(SEL yoo lose, OKS i dyzed re JEN er aye ted)
U.S. Brand NamesSurgicel®; Surgicel® Fibrillar; Surgicel® NuKnit
Pharmacologic CategoryHemostatic Agent
Use: Labeled IndicationsHemostatic; temporary packing for the control of capillary, venous, or small arterial hemorrhage
Use: DentalTo control bleeding created during a dental procedure
Dosing: AdultsBleeding: Topical: Minimal amounts of the fabric strip are laid on the bleeding site or held firmly against the tissues until hemostasis occurs; remove excess material
Dosing: ElderlyRefer to adult dosing.
StorageStore at controlled room temperature. Inactivated by autoclaving; do not resterilize. Do not use if package is damaged. Do not reuse after opening.
ContraindicationsHypersensitivity to any component of the formulation; implantation into bone defects; hemorrhage from large arteries; nonhemorrhagic oozing; use as an adhesion product
Warnings/Precautions

Concerns related to adverse effects:

- Pain/numbness/paralysis: Pain, numbness, or paralysis have been reported if used near a bony or neural space and left inside patient; use minimum amount necessary to achieve hemostasis.

Concurrent drug therapy issues:

- Thrombin: Its hemostatic effect is not enhanced by the addition of thrombin.

Other warnings/precautions:

- Appropriate use: The material should not be moistened before insertion since the hemostatic effect is greater when applied dry. The material should not be impregnated with anti-infective agents. Remove as much of agent as possible after hemostasis is achieved. Do not leave in a contaminated or infected space. Always remove completely following hemostasis if applied in proximity to foramina in bone, areas of bony confine, the spinal cord or optic nerve and chasm; product may swell and exert unwanted pressure.

Pregnancy Risk FactorNo data reported
Adverse ReactionsFrequency not defined.

Central nervous system: Headache

Respiratory: Nasal burning or stinging, sneezing (rhinological procedures)

Miscellaneous: Encapsulation of fluid, foreign body reactions (with or without) infection

Postmarketing and/or case reports: Numbness, pain, paralysis

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Fabric, fibrous (Surgicel® Fibrillar):

1” x 2” (10s)

2” x 4” (10s)

4” x 4” (10s)

Fabric, knitted (Surgicel® NuKnit):

1” x 1” (24s)

1” x 3$^{1}/_{2}$” (10s)

3” x 4” (24s)

6” x 9” (10s)

Fabric, sheer weave (Surgicel®):

$^{1}/_{2}$” x 2” (24s)

2” x 3” (24s)

2” x 14” (24s)

4” x 8” (24s)

Generic AvailableNo

Mechanism of ActionCellulose, oxidized regenerated is saturated with blood at the bleeding site and swells into a brownish or black gelatinous mass which aids in the formation of a clot. When used in small amounts, it is absorbed from the sites of implantation with little or no tissue reaction. In addition to providing hemostasis, oxidized regenerated cellulose also has been shown *in vitro* to have bactericidal properties.

Pharmacodynamics/KineticsAbsorption: 7-14 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAbsorbable Cotton; Oxidized Regenerated Cellulose

Cephalexin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Cephalexin may be confused with cefaclor, ceFAZolin, cephalothin, ciprofloxacin

Pronunciation(sef a LEKS in)
U.S. Brand NamesKeflex®
Canadian Brand NamesApo-Cephalex®; Keftab®; Novo-Lexin; Nu-Cephalex
Pharmacologic CategoryAntibiotic, Cephalosporin (First Generation)
Use: Labeled IndicationsTreatment of susceptible bacterial infections including respiratory tract infections, otitis media, skin and skin structure infections, bone infections, and genitourinary tract infections, including acute prostatitis; alternative therapy for acute infective endocarditis prophylaxis
Use: DentalProphylaxis in total joint replacement patients undergoing dental procedures which produce bacteremia; alternative oral antibiotic for prevention of infective endocarditis in individuals allergic to penicillins or ampicillin

Note: Individuals allergic to amoxicillin (penicillins) may receive cephalexin provided they have not had an immediate, local, or systemic IgE-mediated anaphylactic allergic reaction to penicillin.

Dosing: Adults

Dosing range: Oral: 250-1000 mg every 6 hours (maximum: 4 g/day)

Cellulitis and mastitis: Oral 500 mg every 6 hours

Furunculosis/skin abscess: Oral: 250 mg 4 times/day

Prophylaxis against infective endocarditis (dental, oral, or respiratory tract procedures): Oral: 2 g 30-60 minutes prior to procedure. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur.

Prophylaxis in total joint replacement patients undergoing dental procedures which produce bacteremia: Oral: 2 g 1 hour prior to procedure

Streptococcal pharyngitis, skin and skin structure infections: Oral: 500 mg every 12 hours

Uncomplicated cystitis: Oral: 500 mg every 12 hours for 7-14 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Usual dose: Oral: Children >1 year: Dosing range: 25-100 mg/kg/day in divided doses every 6-8 hours (maximum: 4 g/day)

Furunculosis: Oral: 25-50 mg/kg/day in 4 divided doses

Impetigo: Oral: 25 mg/kg/day in 4 divided doses

Otitis media: 75-100 mg/kg/day in 4 divided doses

Prophylaxis against infective endocarditis (dental, oral, or respiratory tract procedures):

Children >1-15 years: 50 mg/kg 30-60 minutes prior to procedure (maximum: 2 g). **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur.

Children >15 years: Refer to adult dosing.

Severe infections: Oral: 50-100 mg/kg/day in divided doses every 6-8 hours

Skin abscess: Oral: 50 mg/kg/day in 4 divided doses (maximum: 4 g)

Streptococcal pharyngitis, skin and skin structure infections: 25-50 mg/kg/day divided every 12 hours

Uncomplicated cystitis: Children >15 years: Refer to adult dosing.

Dosing: Renal ImpairmentAdults:
Cl_{cr} 10-50 mL/minute: 500 mg every 8-12 hours

Cl_{cr} <10: 250-500 mg every 12-24 hours

Hemodialysis: 250 mg every 12-24 hours; moderately dialyzable (20% to 50%); give dose after dialysis session

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralTake without regard to food. If GI distress, take with food. Give around-the-clock to promote less variation in peak and trough serum levels.

Dietary ConsiderationsTake without regard to food. If GI distress, take with food. Panixine DisperDose™ contains phenylalanine 2.8 mg/cephalexin 125 mg.

Storage

Capsule: Store at 15°C to 30°C (59°F to 86°F).

Powder for oral suspension: Refrigerate suspension after reconstitution; discard after 14 days.

ReconstitutionTablets for oral suspension (Panixine DisperDose™): Tablet must be dissolved in ~10 mL water prior to administration.

ContraindicationsHypersensitivity to cephalexin, any component of the formulation, or other cephalosporins

Allergy Considerations

- Cephalosporin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Elevated INR: May be associated with increased INR, especially in nutritionally-deficient patients, prolonged treatment, hepatic or renal disease.
- Penicillin allergy: Use with caution in patients with a history of penicillin allergy, especially IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria).
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; modify dosage in severe impairment.

Geriatric ConsiderationsAdjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal reproduction studies; therefore, cephalexin is classified as pregnancy category B. Cephalexin crosses the placenta and produces therapeutic concentrations in the fetal circulation and amniotic fluid. An increased risk of teratogenic effects has not been observed following maternal use of cephalexin; however, adequate and well-controlled studies have not been completed in pregnant women. Peak concentrations in pregnant patients are similar to those in nonpregnant patients. Prolonged labor may decrease oral absorption.

LactationEnters breast milk (small amounts)/use caution

Breast-Feeding ConsiderationsSmall amounts of cephalexin are excreted in breast milk. The manufacturer recommends that caution be exercised when administering cephalexin to nursing women. Maximum milk concentration occurs ~4 hours after a single oral dose and gradually disappears by 8 hours after administration. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Cephalexin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Agitation, confusion, dizziness, fatigue, hallucinations, headache

Dermatologic: Angioedema, erythema multiforme (rare), rash, Stevens-Johnson syndrome (rare), toxic epidermal necrolysis (rare), urticaria

Gastrointestinal: Abdominal pain, diarrhea, dyspepsia, gastritis, nausea (rare), pseudomembranous colitis, vomiting (rare)

Genitourinary: Genital pruritus, genital moniliasis, vaginitis, vaginal discharge

Hematologic: Eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia

Hepatic: ALT increased, AST increased, cholestatic jaundice (rare), transient hepatitis (rare)

Neuromuscular & skeletal: Arthralgia, arthritis, joint disorder

Renal: Interstitial nephritis (rare)

Miscellaneous: Allergic reactions, anaphylaxis

Drug Interactions

MetFORMIN: Cephalexin may increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Cephalosporins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Peak antibiotic serum concentration is lowered and delayed, but total drug absorbed is not affected. Cephalexin serum levels may be decreased if taken with food.

Test InteractionsPositive direct Coombs', false-positive urinary glucose test using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution), false-positive serum or urine creatinine with Jaffé reaction, false-positive urinary proteins and steroids

Monitoring ParametersWith prolonged therapy monitor renal, hepatic, and hematologic function periodically; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, nephrotoxicity). Assess results of laboratory tests, therapeutic response, and adverse reactions (see Adverse Reactions). Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, opportunistic infection, hypersensitivity reaction).

Monitoring: Lab TestsRenal, hepatic, and hematologic function periodically with prolonged therapy; perform culture and sensitivity studies prior to initiating drug therapy.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, at regular intervals around-the-clock (with or without food). Take complete prescription even if feeling better. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. May cause diarrhea (yogurt, boiled milk, or buttermilk may help). Report rash; breathing or swallowing difficulty; persistent diarrhea, nausea, vomiting, or abdominal pain; changes in urinary pattern or pain on urination; opportunistic infection (eg, vaginal itching or drainage, sores in mouth, blood in stool or urine, unusual fever or chills); CNS changes (eg, irritability, agitation, nervousness, insomnia, hallucinations); or other adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg, 500 mg

Keflex®: 250 mg, 500 mg, 750 mg

Powder for oral suspension: 125 mg/5 mL (100 mL, 200 mL); 250 mg/5 mL (100 mL, 200 mL)

Keflex®: 125 mg/5 mL (100 mL, 200 mL); 250 mg/5 mL (100 mL, 200 mL)

Tablet: 250 mg, 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Cephalexin)

250 mg/5 mL (200): $19.00

Tablets (Cephalexin)

250 mg (30): $19.99

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: Delayed in young children

Distribution: Widely into most body tissues and fluids, including gallbladder, liver, kidneys, bone, sputum, bile, and pleural and synovial fluids; CSF penetration is poor

Protein binding: 6% to 15%

Half-life elimination: Adults: 0.5-1.2 hours; prolonged with renal impairment

Time to peak, serum: ~1 hour

Excretion: Urine (80% to 100% as unchanged drug) within 8 hours

Related Information

- Cephalosporins by Generation
- Prevention of Infective Endocarditis

Dental Health Professional ConsiderationsCephalexin is effective against anaerobic bacteria, but the sensitivity of alpha-hemolytic *Streptococcus* vary; approximately 10% of strains are resistant. Nearly 70% are intermediately sensitive. Patients allergic to penicillins can use a cephalosporin; the incidence of cross-reactivity between penicillins and cephalosporins is 1% when the allergic reaction to penicillin is delayed. If the patient has a history of immediate reaction to penicillin, the incidence of cross-reactivity is 20%; cephalosporins are contraindicated in these patients.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness; case reports of euphoria, delusion, illusions, and depersonalization with cephalosporins

Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsMay be used for prevention of bacterial endocarditis.

Index TermsCephalexin Monohydrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Tumor Necrosis Factor: Alpha Blockers Associated with Unrecognized Invasive Fungal Infections - September 4, 2008

The U.S. Food and Drug Administration (FDA) is alerting healthcare professionals of an increased risk for opportunistic fungal infections in patients treated with antitumor necrosis factor (anti-TNF) agents adalimumab (Humira®), certolizumab pegol (Cimzia®), etanercept (Enbrel®), and infliximab (Remicade®). The FDA has received reports of pulmonary and disseminated cases of histoplasmosis, coccidioidomycosis, blastomycosis, and other fungal infections associated with use of these agents. In some cases, the symptoms of fungal infection (eg, fever, cough, malaise, dyspnea, fatigue) were unrecognized and precluded prompt antifungal treatment, resulting in 12 deaths. In response, the FDA is requiring manufacturers of these agents to strengthen the boxed warning statement in the labeling to further emphasize the risk of invasive fungal infection. Patients should be monitored closely for signs and symptoms suggestive of fungal infection, evidence of which should result in prompt discontinuation of the medication and appropriate diagnostic evaluation. Symptomatic patients should be questioned about their residence in or travel from areas of endemic mycoses, which should prompt consideration of empiric antifungal therapy.

Additional information can be found at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF2

Tumor Necrosis Factor (TNF) Blockers and Malignancy Risk - June 5, 2008

The U.S. Food and Drug Administration (FDA) issued an Early Communication to healthcare professionals regarding a possible association between TNF blocker (adalimumab, certolizumb pegol, etanercept, and infliximab) use and the development of malignancies in children and young adults. Over the last 10 years, the FDA has received ~30 reports of cancer in children or young adults who had been treated with TNF blockers prior to the age of 18 years. TNF blockers were given for the treatment of Juvenile Idiopathic Arthritis (JIA [formerly termed Juvenile Rheumatoid Arthritis]), Crohn’s disease, or other indications in combination with other immunosuppressive medications (eg, azathioprine, 6-mercaptopurine or methotrexate). Approximately half of the reported cancers were lymphomas (Hodgkin’s and non-Hodgkin’s), which are cancers involving the cells of the immune system.

TNF blockers work by suppressing the immune system. The prescribing information for each TNF blocker contains warnings regarding the possible association of malignancy development with use. Malignancies may not be detected in short-term studies; long-term studies are necessary to identify the impact of TNF blocker therapy on malignancy development. The manufacturers of the four TNF blockers available in the U.S. are being asked by the FDA to provide information regarding all cases of cancer reported in children taking TNF blockers. The FDA is expected to report its findings in approximately 6 months, after completing a safety review and evaluation.

Additional information is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF

Pronunciation(cer to LIZ u mab PEG ol)

U.S. Brand NamesCimzia®

Pharmacologic CategoryGastrointestinal Agent, Miscellaneous; Tumor Necrosis Factor (TNF) Blocking Agent

Use: Labeled IndicationsTreatment of moderately- to severely-active Crohn’s disease in patients who have inadequate response to conventional therapy

Dosing: Adults**Note:** Each 400 mg dose should be administered as 2 injections of 200 mg each

Crohn’s disease: SubQ: Initial: 400 mg, repeat dose 2 and 4 weeks after initial dose; Maintenance: 400 mg every 4 weeks

Dosing: ElderlyRefer to adult dosing.

Administration: OtherSubQ: Bring to room temperature prior to administration. Total dose requires 2 vials; after reconstitution, draw each vial into separate syringes, administer each syringe subcutaneously (using provided 23-gauge needle) to separate sites on abdomen or thigh.

StoragePrior to reconstitution, store intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Reconstituted vials may be retained at room temperature for ≤2 hours or refrigerated for ≤24 hours prior to administration. Do not freeze. Bring to room temperature prior to administration.

ReconstitutionAllow to reach room temperature prior to reconstitution. Using aseptic technique, reconstitute each vial with 1 mL sterile water for injection (provided) to a concentration of ~200 mg/mL; the manufacturer recommends using a 20-gauge needle (provided). Gently swirl to facilitate wetting of powder; do not shake. Allow vials to set undisturbed (may take up to 30 minutes) until fully reconstituted. Reconstituted solutions should not contain visible particles or gels in the solution.

RestrictionsAn FDA-approved medication guide is available, distribute to each patient to whom this medication is dispensed.

ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.

Warnings/Precautions

Boxed warnings:

- Infection: See “Concerns related to adverse effects” below.
- Tuberculosis evaluation: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Autoimmune disorder: Autoantibody formation may develop; rarely resulting in autoimmune disorder, including lupus-like syndrome; monitor and discontinue if symptoms develop.
- Demyelinating CNS disease: Rare cases of optic neuritis, seizure, peripheral neuropathy, and demyelinating disease (new onset or exacerbation) have been reported. Use with caution in patients with pre-existing or recent-onset CNS demyelinating disorders.
- Hematologic effects: Rare cases of pancytopenia and other significant cytopenias, including aplastic anemia, have been reported with TNF-blocking agents. Leukopenia and thrombocytopenia have occurred with certolizumab. Consider discontinuing therapy with significant hematologic abnormalities. Use with caution in patients with underlying hematologic disorders.
- Hepatitis B: Rare and sometimes fatal reactivation of hepatitis B virus (HBV) has occurred in chronic virus carriers. Evaluate prior to initiation, during, and for several months after treatment. Evaluate patients at risk for HBV infection prior to therapy to determine HBV status. Use with extreme caution in patients identified as HBV carriers, use has not been evaluated in this population.
- Hypersensitivity: Hypersensitivity reactions, including angioedema, dyspnea, rash, serum sickness and urticaria have been reported (rarely) with treatment. Discontinue further therapy if hypersensitivity occurs. Use with caution in patients who have experienced hypersensitivity with other TNF blockers.
- Immunogenicity: A small number of patients (8%) develop antibodies to certolizumab during therapy. Antibody-positive patients may have an increased inicidence of adverse events (including injection site pain/erythema, abdominal pain, and erythema nodosom).
- Infections: **[U.S. Boxed Warning]: Serious infections (including tuberculosis, invasive fungal and other opportunistic infections), some with fatalities, have been reported in patients receiving TNF-blocking agents, including certolizumab.** Cases of unrecognized invasive fungal infections (eg, histoplasmosis, blastomycosis, coccidioidomycosis) have also been reported with anti-TNF agent use. Many of the serious infections have occurred in patients on concomitant immunosuppressive therapy. Caution should be exercised when considering the use in patients with a history of chronic or recurrent infection, concomitant immunosuppressive therapy, predisposition to infection (eg, diabetes or residence/travel from areas of endemic mycoses). Do not give to patients with an active chronic or localized infection. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued.
- Malignancy: Use of TNF blockers may affect defenses against malignancies; impact on the development and course of malignancies is not fully defined. Chronic immunosuppressant therapy use may be a predisposing factor for malignancy development.
- Tuberculosis evaluation: Tuberculosis has been reported with certolizumab. **[U.S. Boxed Warnings]: Patients should be evaluated for tuberculosis risk factors and latent tuberculosis infection (with a tuberculin skin test) prior to therapy. Treatment of latent tuberculosis should be initiated before use. Patients with initial negative tuberculin skin tests should receive continued monitoring for tuberculosis throughout treatment;** active tuberculosis has developed in this population during treatment. Use with caution in patients who have resided in regions where tuberculosis is endemic. If appropriate, antituberculosis therapy should be considered (prior to certolizumab treatment) in patients with several or with highly significant risk factors for tuberculosis development.

Disease-related concerns:

- Heart failure: Use with caution in heart failure patients; worsening heart failure and new-onset heart failure have been reported with TNF blockers; monitor closely.

Concurrent drug therapy issues:

- Anakinra: The manufacturer does not recommend concurrent use with anakinra due to the risk of serious infections.

Special populations:

- Elderly: Use with caution in the elderly, may be at higher risk for infections.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy; live vaccines should not be given concurrently. There is no data available concerning the effects of therapy on vaccination or secondary transmission of live vaccines in patients receiving therapy.

Geriatric ConsiderationsStudies to date have insufficient data to make conclusions for use in elderly. Anecdotal reports in clinical settings do not demonstrate any clinical difference between elderly and younger adults. Since elderly have a higher incidence of infection, use with caution and close monitoring.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Headache (7% to 18%)

Gastrointestinal: Nausea (≤11%)

Respiratory: Upper respiratory infection (20%), nasopharyngitis (4% to 13%)

Miscellaneous: Infection (14% to 38%; serious: 3%)

1% to 10%:

Central nervous system: Dizziness (≤6%), fever (≤5%)

Gastrointestinal: Abdominal pain (≤6%), vomiting (5%)

Genitourinary: Urinary tract infection (≤8%)

Local: Injection site reactions (includes bleeding, burning, erythema, inflammation, pain, rash: ≤7%; incidence higher with placebo)

Neuromuscular & skeletal: Arthralgia (6% to 7%)

Respiratory: Cough (≤6%)

Miscellaneous: Antibody formation (8%), positive ANA (4%)

<1%, postmarketing, and/or case reports: Abdominal mass, abscess, alopecia, anemia, angina, anxiety, aphthous stomatitis, aplastic anemia, arrhythmia, bipolar disorder, blurred vision, cytopenia, demyelinating disorder exacerbation, dermatitis, diarrhea, erythema nodosum, gastroenteritis, heart failure, hepatitis, hepatitis B reactivation; hypersensitivity reaction (eg, allergic dermatitis, angioedema, dizziness [postural], dyspnea, hot flush, hypotension, malaise, serum sickness, syncope); hypertension, leukopenia, lupus-like syndrome, lymphadenopathy, malignancy, menstrual disorder, MI, myocardial ischemia, nephrotic syndrome, optic neuritis, pancytopenia, paralytic ileus, pericardial effusion, pericarditis, peripheral neuropathy, pneumonia, pyelonephritis, rash, rectal hemorrhage, renal failure, retinal hemorrhage, seizure, suicide attempt, thrombocytopenia, thrombophilia, transaminases increased, tuberculosis (pulmonary and disseminated), urticaria, uveitis, vasculitis, visual acuity decreased

Drug Interactions

Abatacept: Anti-TNF Agents may enhance the adverse/toxic effect of Abatacept. An increased risk of serious infection during concomitant use has been reported. *Risk D: Consider therapy modification*

Anakinra: Anti-TNF Agents may enhance the adverse/toxic effect of Anakinra. An increased risk of serious infection during concomitant use has been reported. *Risk X: Avoid combination*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Rilonacept: Anti-TNF Agents may enhance the adverse/toxic effect of Rilonacept. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Echinacea may decrease the therapeutic effects of certolizumab; avoid concurrent use.

Monitoring ParametersSigns and symptoms of infection, signs and symptoms of hypersensitivity reaction, symptoms of lupus-like syndrome; hepatitis B virus and TB screening prior to therapy initiation

Nursing: Physical Assessment/MonitoringPerform tuberculin skin test prior to initiating therapy. Monitor for signs of tuberculosis throughout therapy. Do not initiate therapy if active infection (underlying chronic or localized infection) is occurring. Monitor for signs and symptoms of infection. Assess potential for interactions with other prescriptions, OTC medications, and herbal products patient may be taking. Assess results of laboratory tests (PPD), therapeutic effectiveness, and adverse response at regular intervals during treatment. Teach patient proper use if self-injected (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsHepatitis B virus and TB screening prior to therapy initiation

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, allergies, history of tuberculosis, or any kind of infection you have. Do not take any new medication during therapy without consulting prescriber. If self-administered, follow directions for injection and needle/syringe disposal exactly. You may be more susceptible to infection. Do not have any vaccinations while using this medication without consulting prescriber first. May cause headache or dizziness (use caution when driving or engaged in potentially hazardous tasks); if persistent, consult prescriber for approved analgesic. Report persistent fever; respiratory tract infection; unhealed or infected wounds; urinary tract infection; flu-like symptoms; signs of fluid retention (unusual weight gain of >3-5 lbs per week, swelling of the extremities); shortness of breath; or redness, swelling, or pain at injection site. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Cimzia®: 200 mg [contains sterile water for reconstitution, syringes, and needles]

Generic AvailableNo

ManufacturerUCB, Inc

Mechanism of ActionCertolizumab pegol is a pegylated humanized antibody Fab’ fragment of tumor necrosis factor alpha (TNF-alpha) monoclonal antibody. Certolizumab pegol binds to and selectively neutralizes human TNF-alpha activity. (Elevated levels of TNF-alpha have a role in the inflammatory process associated with Crohn’s disease.) Since it is not a complete antibody (lacks Fc region), it does not induce complement activation, antibody-dependent cell-mediated cytotoxicity, or apoptosis. Pegylation of certolizumab allows for delayed elimination and therefore an extended half-life.

Pharmacodynamics/Kinetics

Distribution: V_{ss}: 6.4 L

Bioavailability: SubQ: ~80% (range: 76% to 88%)

Half-life elimination: ~14 days

Time to peak, plasma: 54-171 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Aphthous ulcers reported in <1% of patients.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadache is common; may cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine, carbamazepine, and valproic acid. May cause GI side effects; concomitant use with SSRIs, lithium, carbamazepine, or valproic acid may produce additive effects.

Index TermsCDP870

U.S. Brand NamesZyrtec-D 12 Hour® [DSC]; Zyrtec-D® Allergy & Congestion [OTC]

Canadian Brand NamesReactine® Allergy and Sinus

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled IndicationsTreatment of symptoms of seasonal or perennial allergic rhinitis

Dosing: AdultsSeasonal/perennial allergic rhinitis: Oral: 1 tablet twice daily

Dosing: ElderlyAdjust dose according to renal dysfunction.

Dosing: PediatricNot indicated for use in children <12 years; see adult dosing for children ≥12 years

Dosing: Renal ImpairmentCl_{cr} 11-31 mL/minute or if patient is on hemodialysis: Oral: 1 tablet once daily

Dosing: Hepatic ImpairmentOral: 1 tablet once daily

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralTablet should be swallowed whole; do not break, crush, or chew.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to hydroxyzine, adrenergic agents, cetirizine, pseudoephedrine, or any component of the formulation; MAO inhibitor therapy or use within 14 days of discontinuing MAO inhibitor therapy; narrow-angle glaucoma; urinary retention; severe hypertension; severe coronary artery disease

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment required.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorC

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsCetirizine and pseudoephedrine are excreted in breast milk. Pseudoephedrine: 0.4% to 0.7% of the dose was estimated to be excreted in breast milk over 24 hours after a single dose; breast milk concentrations were two- to threefold higher than those in plasma.

Adverse ReactionsPercentages reported with combination product. Additional adverse effects reported; refer to individual agents.

1% to 10%:

Central nervous system: Insomnia (4%), fatigue (2%), somnolence (2%), dizziness (1%)

Gastrointestinal: Xerostomia (4%)

Respiratory: Pharyngitis (2%), epistaxis (1%)

Metabolism/Transport EffectsCetirizine: **Substrate** of CYP3A4 (minor)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Cetirizine's absorption and maximal concentration are reduced when taken with food; may be taken without regard to meals.

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid ephedra, yohimbe (may cause hypertension). Avoid valerian, kava kava, gotu kola (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, extended release: Cetirizine hydrochloride 5 mg and pseudoephedrine hydrochloride 120 mg

Zyrtec-D 12 Hour® [DSC], Zyrtec-D® Allergy & Congestion: Cetirizine hydrochloride 5 mg and pseudoephedrine hydrochloride 120 mg

Generic AvailableYes

ManufacturerPfizer Labs

Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Zyrtec-D)

5-120 mg (30): $42.99

Mechanism of ActionCetirizine is an antihistamine; exhibits selective inhibition of H_1 receptors. Pseudoephedrine is a sympathomimetic and exerts a decongestant action on nasal mucosa.

Pharmacodynamics/Kinetics

Zyrtec-D 12 Hour™:

Half-life elimination: Cetirizine: 7.9 hours; Pseudoephedrine: 6 hours

Time to peak: Cetirizine: 2.2 hours; Pseudoephedrine: 4.4 hours

Excretion: Urine (70%); feces (10%)

See individual agents.

Related Information

- Cetirizine
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDrowsiness is common; may cause abnormal thinking, agitation, amnesia, anxiety, depersonalization, depression, emotional lability, euphoria, impaired concentration, insomnia, nervousness, paroniria, and sleep disturbances. May also cause aggressive reactions.

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors or within 14 days of discontinuation of MAO inhibitors

Zyrtec® may be confused with Serax®, Xanax®, Zantac®, Zyprexa®

Pronunciation(se TI ra zeen)
U.S. Brand NamesZyrtec® Allergy [OTC]; Zyrtec® [OTC]; Zyrtec®, Children's Allergy [OTC]; Zyrtec®, Children's Hives Relief [OTC]
Canadian Brand NamesApo-Cetirizine®; Reactine™
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation
Use: Labeled IndicationsPerennial and seasonal allergic rhinitis and other allergic symptoms including urticaria; chronic idiopathic urticaria
Dosing: AdultsPerennial or seasonal allergic rhinitis, chronic urticaria: Oral: 5-10 mg once daily, depending upon symptom severity
Dosing: ElderlyOral: Initial: 5 mg once daily; may increase to 10 mg/day

Note: Manufacturer recommends 5 mg/day in patients ≥77 years of age.

Dosing: Pediatric

Perennial allergic rhinitis, chronic urticaria: Oral:

6-12 months: 2.5 mg once daily

12 months to <2 years: 2.5 mg once daily; may increase to 2.5 mg every 12 hours if needed

Perennial or seasonal allergic rhinitis, chronic urticaria: Oral:

2-5 years: Initial: 2.5 mg once daily; may be increased to 2.5 mg every 12 hours **or** 5 mg once daily

≥6 years: Refer to adult dosing.

Dosing: Renal Impairment

Children <6 years: Cetirizine use not recommended.

Children 6-11 years: <2.5 mg once daily

Children ≥12 and Adults:

Cl_{cr} 11-31 mL/minute or hemodialysis: Administer 5 mg once daily

Cl_{cr} <11 mL/minute, not on dialysis: Cetirizine use not recommended.

Dosing: Hepatic Impairment

Children <6 years: Cetirizine use not recommended.

Children 6-11 years: <2.5 mg once daily

Children ≥12 and Adults: Administer 5 mg once daily

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be administered with or without food.
Dietary ConsiderationsMay be taken with or without food.
Storage

Syrup: Store at room temperature of 15°C to 30°C (59°F to 86°F), or under refrigeration at 2°C to 8°C (36°F to 46°F).

Tablet: Store at room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to cetirizine, hydroxyzine, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Safety and efficacy have not been established in children <6 months of age.

Geriatric ConsiderationsAdjust dose for renal function.
Pregnancy Risk FactorB
Pregnancy ConsiderationsCetirizine was not shown to be teratogenic in animal studies, however, adequate studies have not been conducted in pregnant women. Use during pregnancy only if clearly needed.
LactationEnters breast milk/not recommended
Adverse Reactions

>10%: Central nervous system: Headache (children 11% to 14%, placebo 12%), somnolence (adults 14%, children 2% to 4%)

2% to 10%:

Central nervous system: Insomnia (children 9%, adults <2%), fatigue (adults 6%), malaise (4%), dizziness (adults 2%)

Gastrointestinal: Abdominal pain (children 4% to 6%), dry mouth (adults 5%), diarrhea (children 2% to 3%), nausea (children 2% to 3%, placebo 2%), vomiting (children 2% to 3%)

Respiratory: Epistaxis (children 2% to 4%, placebo 3%), pharyngitis (children 3% to 6%, placebo 3%), bronchospasm (children 2% to 3%, placebo 2%)

<2% (as reported in adults and/or children): Abdomen enlarged, accommodation loss, acne, alopecia, amnesia, anaphylaxis, angioedema, anorexia, anxiety, appetite increased, arthralgia, arthritis, arthrosis, ataxia, back pain, bilirubin increased, blindness, breast pain (female), bronchitis, bullous eruption, cardiac failure, chest pain, cholestasis, concentration impaired, confusion, conjunctivitis, constipation, coordination abnormal, cystitis, deafness, dehydration, depersonalization, depression, dermatitis, diabetes mellitus, dry skin, dysmenorrhea, dyspepsia, dysphonia, dyspnea, dysuria, earache, eczema, edema, emotional lability, eructation, erythematosus rash, euphoria, eye pain, face edema, fever, flatulence, flushing, furunculosis, fussiness, gastritis, glaucoma, glomerulonephritis, hematuria, hemolytic anemia, hemorrhoids, hepatitis, hot flashes, hyperesthesia, hyperkeratosis, hyperkinesia, hypertension, hypertonia, hypertrichosis, hyperventilation, hypoesthesia, hypotension, intermenstrual bleeding, irritability, leg cramps, leg edema, leukorrhea, libido decreased, liver enzymes elevated (transient), liver function abnormal, lymphadenopathy, maculopapular rash, melena, menorrhagia, micturition frequency, migraine, muscle weakness, myalgia, myelitis, nasal polyp, nervousness, ocular hemorrhage, orofacial dyskinesia, ototoxicity, pain, pallor, palpitation, paralysis, paresthesia, paroniria, parosmia, periorbital edema, photosensitivity, pneumonia, polyuria, pruritus, ptosis, purpura, rash, rectal hemorrhage, respiratory disorder, rhinitis, rigors, salivation increased, seborrhea, sinusitis, skin disorder, skin nodule, sleep disorder, sputum increased, stomatitis, sweating, syncope, tachycardia, taste loss, taste perversion, thinking abnormal, thirst, thrombocytopenia, tinnitus, tongue discoloration, tongue edema, tremor, twitching, ulcerative stomatitis, upper respiratory tract infection, urinary incontinence, urinary retention, urinary tract infection, urticaria, vaginitis, vertigo, visual field defect, weakness, weight gain, xerophthalmia

Postmarketing and/or case reports: Aggressive reaction, convulsions, hallucinations, hypotension (severe), suicidal ideation, suicide

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersRelief of symptoms, sedation and anticholinergic effects

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. Breast-feeding is not recommended.

Patient EducationTake as directed; do not exceed recommended dose. Avoid use of other depressants, alcohol, or sleep-inducing medications unless approved by prescriber. You may experience drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth (frequent small meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report persistent sedation, confusion, or agitation; persistent nausea or vomiting; changes in urinary pattern; blurred vision; chest pain or palpitations; persistent headaches; or lack of improvement or worsening of condition. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Syrup, as hydrochloride: 5 mg/5 mL (120 mL, 473 mL)

Zyrtec®: 5 mg/5 mL (120 mL, 480 mL) [contains propylene glycol; banana-grape flavor]

Zyrtec®, Children's Allergy, Zyrtec®, Children's Hives Relief: 5 mg/5 mL (120 mL) [contains propylene glycol; grape flavor]

Tablet, as hydrochloride: 5 mg, 10 mg

Zyrtec®: 5 mg, 10 mg [DSC]

Zyrtec® Allergy: 10 mg

Tablet, chewable, as hydrochloride:

Zyrtec®: 5 mg, 10 mg [grape flavor] [DSC]

Zyrtec®, Children's Allergy: 5 mg, 10 mg [grape flavor]

Generic AvailableYes

ManufacturerPfizer U.S. Pharmaceuticals Group

Pricing: U.S. (www.drugstore.com)

Tablets (Cetirizine HCl)

10 mg (100): $99.99

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pharmacodynamics/Kinetics

Onset of action: 15-30 minutes

Absorption: Rapid

Protein binding, plasma: Mean: 93%

Metabolism: Limited hepatic

Half-life elimination: 8 hours

Time to peak, serum: 1 hour

Excretion: Urine (70%); feces (10%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and increased salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause abnormal thinking, agitation, amnesia, anxiety, depersonalization, depression, emotional lability, euphoria, impaired concentration, insomnia, nervousness, paroniria, and sleep disturbances. May also cause aggressive reactions.

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Index TermsCetirizine Hydrochloride; P-071; UCB-P071

Cetrorelix

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(set roe REL iks)

U.S. Brand NamesCetrotide®

Canadian Brand NamesCetrotide®

Pharmacologic CategoryGonadotropin Releasing Hormone Antagonist

Use: Labeled IndicationsInhibits premature luteinizing hormone (LH) surges in women undergoing controlled ovarian stimulation

Dosing: Adults

Controlled ovarian stimulation in conjunction with gonadotropins (FSH, HMG): Female: SubQ:

Single-dose regimen: 3 mg given when serum estradiol levels show appropriate stimulation response, usually stimulation day 7 (range days 5-9). If hCG is not administered within 4 days, continue cetrorelix at 0.25 mg/day until hCG is administered.

Multiple-dose regimen: 0.25 mg morning or evening of stimulation day 5, or morning of stimulation day 6; continue until hCG is administered.

Dosing: ElderlyNot intended for use in women ≥65 years of age (Phase 2 and Phase 3 studies included women 19-40 years of age).

Dosing: Renal Impairment

Severe impairment: Use is contraindicated.

Mild-to-moderate impairment: No specific guidelines are available.

Administration: OtherCetrorelix is administered by SubQ injection following proper aseptic technique procedures. Injections should be to the lower abdomen, preferably around the navel (but staying at least 1 inch from the navel). The injection site should be rotated daily. The needle should be inserted completely into the skin at a 45-degree angle.

StorageStore in outer carton. Once mixed, solution should be used immediately.

0.25 mg vials: Store under refrigeration at 2°C to 8°C (36°F to 46°F).

3 mg vials: Store at controlled room temperature at 25°C (77°F).

ContraindicationsHypersensitivity to cetrorelix or any component of the formulation; extrinsic peptide hormones, mannitol, gonadotropin releasing hormone (GnRH) or GnRH analogs; severe renal impairment; pregnancy; breast-feeding

Allergy Considerations

- GnRH Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Monitor carefully after first injection for possible hypersensitivity reactions.

Disease-related concerns:

- Allergies: Use with caution in women with active allergic conditions or a history of allergies; use in women with severe allergic conditions is not recommended.

Special populations:

- Pregnancy: Exclude pregnancy before beginning treatment.

Other warnings/precautions:

- Experienced specialists: Should only be prescribed by fertility specialists.

Pregnancy Risk FactorX

Pregnancy ConsiderationsAnimal studies have shown fetal resorption and implantation losses following administration. Resorption resulting in fetal loss would be expected if used in a pregnant woman.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

1% to 10%:

Central nervous system: Headache (1%)

Endocrine & metabolic: Ovarian hyperstimulation syndrome, WHO grade II or III (4%)

Gastrointestinal: Nausea (1%)

Hepatic: ALT, AST, GGT, and alkaline phosphatase increased (1% to 2%)

Postmarketing and/or case reports: Severe anaphylactic reaction (cough, rash, hypotension) occurred in one patient following several months of treatment in a study not related to fertility. Congenital abnormalities and stillbirths have been reported, however, the relationship to cetrorelix treatment has not been established. Local injection site reactions (bruising, erythema, itching, pruritus, redness, swelling) have also been reported.

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersUltrasound to assess follicle size
Nursing: Physical Assessment/MonitoringThis medication should only be prescribed by a fertility specialist. Teach patient proper use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Pregnancy must be excluded before starting medication. Breast-feeding is not recommended.
Patient EducationThis drug can only be given by injection as demonstrated. An instructional leaflet will be provided if you will be administering this medication to yourself. Instructions will be given on how to administer SubQ injections and proper disposal of syringes and needles. Give at a similar time each day as instructed by prescriber. Do not skip any doses. If you miss an injection, do not double next dose; contact your prescriber. You must keep all scheduled ultrasound appointments. Store in refrigerator in outer carton. Solution should be used immediately after mixing. You may experience headache (use of mild analgesic may help); or nausea (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help). Report immediately any sudden or acute abdominal pain; shortness of breath; vaginal bleeding; or pain, itching, or signs of infection at injection site. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this drug. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Cetrotide®: 0.25 mg, 3 mg [contains mannitol]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Kit (Cetrotide)

0.25 mg (1): $122.31

3 mg (1): $606.61

Mechanism of ActionCompetes with naturally-occurring GnRH for binding on receptors of the pituitary. This delays luteinizing hormone surge, preventing ovulation until the follicles are of adequate size.
Pharmacodynamics/Kinetics

Onset of action: 0.25 mg dose: 2 hours; 3 mg dose: 1 hour

Duration: 3 mg dose (single dose): 4 days

Absorption: Rapid

Distribution: V_d: ~1 L/kg

Protein binding: 86%

Metabolism: Transformed by peptidases; cetrorelix and peptides (1-9), (1-7), (1-6), and (1-4) are found in the bile; peptide (1-4) is the predominant metabolite

Bioavailability: 85%

Half-life elimination: 0.25 mg dose: 5 hours; 0.25 mg multiple doses: 20.6 hours; 3 mg dose: 62.8 hours

Time to peak: 0.25 mg dose: 1 hour; 3 mg dose: 1.5 hours

Excretion: Feces (5% to 10% as unchanged drug and metabolites); urine (2% to 4% as unchanged drug); within 24 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsCetrorelix Acetate

Cetuximab-Irinotecan

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic CategoryChemotherapy Regimen, Colorectal Cancer
Regimen UseColorectal cancer
Index TermsIrinotecan-Cetuximab
RegimenNOTE: Multiple variations are listed below.

Variation 1:

- Cycle 1:
  - Cetuximab: I.V.: 400 mg/m^2 (loading dose) day 1 (week 1, cycle 1 only)
    - [total loading dose = 400 mg/m^2]
      - **followed by** I.V.: 250 mg/m^2/day days 8, 15, 22, 29, and 36
        - [total dose/cycle 1 = 1650 mg/m^2]
  - Irinotecan: I.V.: 125 mg/m^2/day days 1, 8, 15, and 22
    - [total dose/cycle = 500 mg/m^2]
- Subsequent cycles:
  - Cetuximab: I.V.: 250 mg/m^2/day days 1, 8, 15, 22, 29, and 36
    - [total dose/cycle = 1500 mg/m^2]
  - Irinotecan: I.V.: 125 mg/m^2/day days 1, 8, 15, and 22
    - [total dose/cycle = 500 mg/m^2]
- Repeat cycle every 42 days

Variation 2:

- Cycle 1:
  - Cetuximab: I.V.: 400 mg/m^2 (loading dose) day 1 (week 1, cycle 1 only)
    - [total loading dose = 400 mg/m^2]
      - **followed by** I.V.: 250 mg/m^2 day 8
        - [total dose/cycle 1 = 650 mg/m^2]
  - Irinotecan: I.V.: 180 mg/m^2 day 1
    - [total dose/cycle = 180 mg/m^2]
- Subsequent cycles:
  - Cetuximab: I.V.: 250 mg/m^2/day days 1 and 8
    - [total dose/cycle = 500 mg/m^2]
  - Irinotecan: I.V.: 180 mg/m^2 day 1
    - [total dose/cycle = 180 mg/m^2]
- Repeat cycle every 14 days

Variation 3:

- Cycle 1:
  - Cetuximab: I.V.: 400 mg/m^2 (loading dose) day 1 (week 1, cycle 1 only)
    - [total loading dose = 400 mg/m^2]

followed by I.V.: 250 mg/m^2/day days 8 and 15 (cycle 1)

[total dose/cycle 1 = 900 mg/m^2]

Irinotecan: I.V.: 350 mg/m^2 day 1

[total dose/cycle = 350 mg/m^2]

Subsequent cycles:

Cetuximab: I.V.: 250 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 750 mg/m^2]

Irinotecan: I.V.: 350 mg/m^2 day 1

[total dose/cycle = 350 mg/m^2]

Repeat cycle every 21 days

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cetuximab may be confused with bevacizumab

Pronunciation(se TUK see mab)

U.S. Brand NamesErbitux®

Canadian Brand NamesErbitux®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody; Epidermal Growth Factor Receptor (EGFR) Inhibitor

Use: Labeled IndicationsTreatment of metastatic colorectal cancer; treatment of squamous cell cancer of the head and neck

Use: Unlabeled/InvestigationalTreatment of EGFR-expressing advanced nonsmall cell lung cancer (NSCLC)

Dosing: Adults **Note:** Premedicate with an H_1 antagonist (eg, diphenhydramine) I.V. 30-60 minutes prior to the first dose; premedication for subsequent doses is based on clinical judgement.

Colorectal cancer: I.V.:

Initial loading dose: 400 mg/m^2 infused over 120 minutes

Maintenance dose: 250 mg/m^2 infused over 60 minutes weekly

Biweekly administration (unlabeled dosing): 500 mg/m^2 every 2 weeks (initial dose infused over 120 minutes, subsequent doses infused over 60 minutes) (Pfeiffer, 2007)

Head and neck cancer: I.V.:

Initial loading dose: 400 mg/m^2 infused over 120 minutes

Maintenance dose: 250 mg/m^2 infused over 60 minutes weekly

Note: If given in combination with radiation therapy, administer loading dose 1 week prior to initiation of radiation course. Weekly maintenance dose should be completed 1 hour prior to radiation for the duration of radiation therapy (6-7 weeks).

NSCLC (unlabeled use): Initial loading dose: 400 mg/m^2, followed by maintenance dose: 250 mg/m^2 weekly (Pirker, 2008)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic ImpairmentNo adjustment required.

Dosing: Adjustment for Toxicity

Infusion reactions, grade 1 or 2 and nonserious grades 3 or 4: Reduce the infusion rate by 50% and continue to use prophylactic antihistamines

Infusion reactions, severe: Immediately and permanently discontinue treatment

Pulmonary toxicity:

Acute onset or worsening pulmonary symptoms: Hold treatment

Interstitial lung disease: Permanently discontinue

Skin toxicity, mild to moderate: No dosage modification required

Acneiform rash, severe (grade 3 or 4):

- First occurrence: Delay cetuximab infusion 1-2 weeks
  - If improvement, continue at 250 mg/m^2
  - If no improvement, discontinue therapy
- Second occurrence: Delay cetuximab infusion 1-2 weeks
  - If improvement, continue at reduced dose of 200 mg/m^2
  - If no improvement, discontinue therapy

Third occurrence: Delay cetuximab infusion 1-2 weeks

If improvement, continue at reduced dose of 150 mg/m^2

If no improvement, discontinue therapy

Fourth occurrence: Discontinue therapy

Note: Dose adjustments are not recommended for severe **radiation** dermatitis.

Dosing: Combination Regimens

Colorectal cancer:

- Cetuximab (Biweekly)-Irinotecan
- Cetuximab-FOLFOX4
- Cetuximab-Irinotecan

Head and neck cancer:

- Carboplatin-Cetuximab
- Cetuximab-Carboplatin-Fluorouracil
- Cetuximab-Cisplatin-Fluorouracil
- Cisplatin-Cetuximab
- Paclitaxel-Cetuximab

Lung cancer, nonsmall cell: Cetuximab-Cisplatin-Vinorelbine

Calculations

- Body Surface Area: Adults

Administration: I.V.I.V. infusion; loading dose over 2 hours, weekly maintenance dose over 1 hour. Do not administer as I.V. push or bolus. Do not shake or dilute. Administer via infusion pump or syringe pump. Following the infusion, an observation period (1 hour) is recommended; longer observation time (following an infusion reaction) may be required. Premedication with an H_1 antagonist prior to the initial dose is recommended. The maximum infusion rate is 10 mg/minute. Administer through a low protein-binding 0.22 micrometer in-line filter. Use 0.9% NaCl to flush line at the end of infusion.

For biweekly administration (unlabeled frequency and dose), the initial dose was infused over 120 minutes and subsequent doses infused over 60 minutes (Pfeiffer, 2007).

Administration: I.V. DetailpH: 7-7.4; may contain a small amount of visible white, amorphous cetuximab particles

StorageStore unopened vials under refrigeration at 2°C to 8°C (36°F to 46°F). Do not freeze. Preparations in infusion containers are stable for up to 12 hours under refrigeration at 2°C to 8°C (36°F to 46°F) and up to 8 hours at room temperature of 20°C to 25°C (68°F to 77°F).

ReconstitutionReconstitution is not required. Appropriate dose should be added to empty sterile container; do not shake or dilute.

ContraindicationsThere are no contraindications listed in the manufacturer's labeling

Warnings/Precautions

Boxed warnings:

- Cardiopulmonary arrest: See "Concerns related to adverse effects" below.
- Infusion/hypersensitivity reactions: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Cardiopulmonary arrest: **[U.S. Boxed Warning]: Cardiopulmonary arrest has been reported in patients receiving radiation therapy in combination with cetuximab.** Closely monitor serum electrolytes (magnesium, potassium, calcium) during and after (for at least 8 weeks) cetuximab therapy. Use caution with history of coronary artery disease, HF, and arrhythmias.
- Dermatologic toxicity: Acneiform rash has been reported in 76% to 88% of patients (severe in 1% to 17%), usually developing within the first 2 weeks of therapy; may require dose modification. Acneiform rash should be treated with topical and/or oral antibiotics; topical corticosteroids are not recommended. Other dermatologic toxicities, including dry skin, fissures, hypertrichosis, paronychial inflammation, and skin infections have been reported; related ocular toxicities (blepharitis, conjunctivitis, keratitis) may also occur. Sunlight may exacerbate skin reactions. In colorectal cancer, the presence of acneiform rash correlates with treatment response and prolonged survival (Cunningham, 2004).
- Electrolyte abnormality: Hypomagnesemia is common; the onset of electrolyte disturbance may occur within days to months after initiation of treatment; monitor.
- Infusion/hypersensitivity reactions: **[U.S. Boxed Warning]: Severe infusion reactions (bronchospasm, stridor, hoarseness, urticaria, hypotension, loss of consciousness, shock, MI, cardiac arrest) have been reported in ~3% of patients; fatal outcome has been reported rarely.** Approximately 90% of reactions occur with the first infusion despite the use of prophylactic antihistamines. **Note:** Although a 20 mg test dose was used in some studies, it did not reliably predict the risk of an infusion reaction, and is not recommended. In case of severe reaction, treatment should be stopped and permanently discontinued. Immediate treatment for anaphylactic/anaphylactoid reactions should

be available during administration. The manufacturer recommends monitoring patients for at least 1 hour following completion of infusion, or longer if a reaction occurs. Mild-to-moderate infusion reactions (chills, fever, dyspnea) are managed by slowing the infusion rate (by 50%) and administering antihistamines. Patients with pre-existing IgE antibody against cetuximab (specific for galactose-α-1,3-galactose) are reported to have a higher incidence of severe hypersensitivity reaction. Severe hypersensitivity reaction has been reported more frequently in patients living in the middle south area of the United States, including North Carolina and Tennessee (O'Neil, 2007; Chung, 2008).

- Interstitial lung disease (ILD): Has been reported; use with caution in patients with pre-existing lung disease. Permanently discontinue with confirmed ILD.

Concurrent drug therapy issues:

- Combination with cisplatin and radiation therapy: Safety and efficacy have not been established when used in combination with radiation therapy and cisplatin.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Anticetuximab antibodies: Non-neutralizing anticetuximab antibodies were detected in 5% of evaluable patients. Relationship between the appearance of antibodies and the safety or antitumor activity of the molecule is unknown.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIn pregnant cynomolgus monkeys, cetuximab was detected in the amniotic fluid and in the serum of embryos. Although teratogenic effects were not observed in animal studies, increases in embryolethality and fetal loss were noted. There are no adequate and well-controlled studies in pregnant women. It is not known whether cetuximab can cause fetal harm or affect reproductive capacity. Because cetuximab inhibits epidermal growth factor (EGF), a component of fetal development, adverse effects on pregnancy would be expected. Cetuximab should only be given to a pregnant woman if the potential benefit justifies the potential risk to the fetus.

LactationExcretion in breast milk is unknown/not recommended

Breast-Feeding ConsiderationsBreast-feeding should be discontinued during treatment and for at least 60 days following the last dose.

Adverse ReactionsExcept where noted, percentages reported for cetuximab monotherapy.

>10%:

Central nervous system: Fatigue (89%), pain (17% to 51%), headache (26% to 33%), insomnia (10% to 30%), fever (27% to 30%), confusion (15%), anxiety (14%), chills/rigors (13%), depression (7% to 13%)

Dermatologic: Acneiform rash (76% to 90%; grades 3/4: 1% to 17%; onset: ≤14 days), rash (89%), dry skin (49%), pruritus (11% to 40%), nail changes/disorder (16% to 21%)

Endocrine & metabolic: Hypomagnesemia (55%; grades 3/4: 6% to 17%)

Gastrointestinal: Abdominal pain (26% to 59%), constipation (26% to 46%), diarrhea (25% to 39%), vomiting (25% to 37%), nausea (mild-to-moderate 29%), weight loss (7% to 27%), anorexia (23%), stomatitis (10% to 25%), xerostomia (11%)

Neuromuscular & skeletal: Weakness (45% to 48%), bone pain (15%)

Respiratory: Dyspnea (17% to 48%), cough (11% to 29%)

Miscellaneous: Infection (13% to 35%), infusion reaction (15% to 21%; grades 3/4: 2% to 5%; 90% of severe reactions occurred with first infusion)

1% to 10%:

Cardiovascular: Peripheral edema (10%), cardiopulmonary arrest (2%; with radiation therapy)

Dermatologic: Alopecia (4%), skin disorder (4%)

Endocrine & metabolic: Dehydration (2% to 10%)

Gastrointestinal: Dyspepsia (6%)

Hematologic: Anemia (9%)

Hepatic: Alkaline phosphatase increased (5% to 10%), transaminases increased (5% to 10%)

Neuromuscular & skeletal: Back pain (10%)

Ocular: Conjunctivitis (7%)

Renal: Renal failure (1%)

Respiratory: Pulmonary embolus (1%)

Miscellaneous: Sepsis (1% to 4%)

<1%, postmarketing, and/or case reports: Abscess formation, arrhythmia, blepharitis, bronchospasm, cardiac arrest, cellulitis, cheilitis, hoarseness, hypertrichosis, hypotension, interstitial lung disease (occurred between the fourth and eleventh doses), keratitis, leukopenia, loss of consciousness, MI, paronychial inflammation, sepsis, shock, skin fissure, skin infection, stridor

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)
Drug InteractionsThere are no known significant interactions.
Monitoring ParametersVital signs during infusion and observe for at least 1 hour postinfusion. Patients developing dermatologic toxicities should be monitored for the development of complications. Periodic monitoring of serum magnesium, calcium, and potassium are recommended to continue over an interval consistent with the half-life (8 weeks); monitor closely (during and after treatment) for cetuximab plus radiation therapy. KRAS genotyping of tumor tissue in patients with colorectal cancer.
Nursing: Physical Assessment/MonitoringUse caution with pre-existing coronary or lung disease. Premedication with antihistamines is recommended. Patient must be monitored closely for adverse reactions (eg, airway obstruction, hives, hypotension) during and for 1 hour following infusion. Treatment for anaphylactic reactions should be available. In case of severe infusion reaction, treatment should be stopped and prescriber notified. Dosing adjustment or permanent discontinuation may be necessary in event of infusion reaction. Evaluate results of laboratory tests prior to and periodically during treatment. Assess therapeutic response and adverse reactions. Teach patient possible side effects/interventions and adverse symptoms to report (eg, skin reactions, cough, dyspnea, gastrointestinal upset, opportunistic infection).
Monitoring: Lab TestsPeriodic monitoring of serum magnesium, calcium, and potassium are recommended to continue over an interval consistent with the half-life (8 weeks); monitor closely (during and after treatment) for cetuximab plus radiation therapy. KRAS genotyping of tumor tissue in patients with colorectal cancer.
Patient EducationDo not take any new prescription, OTC medications, or herbal products during therapy unless approved by prescriber. This medication can only be administered by infusion and you will be closely monitored during each infusion. Report immediately unusual chest tightness; difficulty breathing or swallowing; itching or skin rash; back pain or acute headache; or redness, swelling, or pain at infusion site. Maintain adequate nutrition (small, frequent meals) and hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience feelings of weakness or fatigue (adequate rest is important); nausea, vomiting, or loss of appetite (small, frequent meals, sucking lozenges, or chewing gum may help); diarrhea (boiled milk or yogurt may help); headache or back pain (consult prescriber for appropriate analgesic); skin rash or dryness (avoid sunlight, use protective clothing, use only mild soap, and consult prescriber for approved lotion); or loss of hair or nail disorder (may grow back after therapy). Report immediately chest pain, irregular heart beat, or palpitations; difficulty breathing; persistent gastrointestinal disturbances (pain, constipation, diarrhea, vomiting); CNS changes (depression or insomnia); skin rash, dryness, or cracking; any signs of infection; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed during therapy or for 60 days following completion.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Erbitux®: 2 mg/mL (50 mL, 100 mL)

Generic AvailableNo
ManufacturerImClone (distributed/marketed by Bristol-Myers Squibb)
Pricing: U.S. (www.drugstore.com)

Solution (Erbitux)

100 mg/50 mL (50): $570.00

Mechanism of ActionRecombinant human/mouse chimeric monoclonal antibody which binds specifically to the epidermal growth factor receptor (EGFR, HER1, c-ErbB-1) and competitively inhibits the binding of epidermal growth factor (EGF) and other ligands. Binding to the EGFR blocks phosphorylation and activation of receptor-associated kinases, resulting in inhibition of cell growth, induction of apoptosis, and decreased matrix metalloproteinase and vascular endothelial growth factor production.
Pharmacodynamics/Kinetics

Distribution: V_d: ~2-3 L/m^2

Half-life elimination: ~112 hours (range: 63-230 hours)

Pharmacotherapy Pearls**Oncology Comment:** EGFR expression is detected in nearly all patients with head and neck cancer; laboratory evidence of EGFR expression is not necessary for head and neck cancers.

The National Comprehensive Cancer Network® (NCCN) guidelines for colon cancer (v.3.2008) recommend genotyping tumor tissue for KRAS mutation in all patients with metastatic colorectal cancer (genotyping may be done on archived specimens). Patients with known codon 12 or 13 KRAS gene mutations are unlikely to respond to EGFR inhibitors and should not receive cetuximab. Favorable progression-free survival and overall survival has been demonstrated with cetuximab in patients with KRAS wild-type (Karapetis, 2008; Van Cutsem, 2008). Because EGFR testing in colorectal tumors does not correlate with response, the NCCN guidelines do not recommend routine EGFR testing in colorectal cancer. Dermatologic toxicity with cetuximab is predictive for response; the presence of acneiform rash correlates with treatment response and prolonged survival (Cunningham, 2004).

The NCCN Non-Small Cell Lung cancer guidelines (v.2.2009) recommend cetuximab in combination with cisplatin and vinorelbine as a first-line therapy option in patients with advanced (stage IIIB or IV disease), with EGFR expression and a performance status of 0-2.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause malaise, insomnia, or depression
Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; these effects may be additive with concurrent use of SSRIs, acetylcholinesterase inhibitors, aripiprazole, or ziprasidone. May cause anemia and leukopenia; use caution with clozapine and carbamazepine.

Dietary ConsiderationsTake with or without food.
StorageStore at 25°C (77°F).
ContraindicationsHypersensitivity to cevimeline or any component of the formulation; uncontrolled asthma; narrow-angle glaucoma; acute iritis; other conditions where miosis is undesirable
Allergy Considerations

- Cevimeline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Parasympathomimetic effects: May cause a variety of parasympathomimetic effects, which may be particularly dangerous in elderly patients; excessive sweating may lead to dehydration in some patients.

- Visual effects: May cause decreased visual acuity (particularly at night and in patients with central lens changes) and impaired depth perception. Patients should be cautioned about driving at night or performing hazardous activities in reduced lighting.

Disease-related concerns:

- Biliary stones: Use with caution in patients with a history of biliary stones; may may induce smooth muscle spasms, precipitating cholangitis, cholecystitis, or biliary obstruction in susceptible patients.

- Cardiovascular disease: Use with caution in patients with significant cardiovascular disease (including angina, myocardial infarction, or conduction disturbances); may alter cardiac conduction and/or heart rate.

- Nephrolithiasis: Use with caution in patients with a history of nephrolithiasis; may induce smooth muscle spasms, precipitating renal colic or ureteral reflux in susceptible patients.

- Respiratory disease: Use with caution in patients with controlled asthma, COPD, or chronic bronchitis; may increase bronchial smooth muscle tone, airway resistance, and bronchial secretions.

Special populations:

- Patients with CYP2D6 deficiency: Patients with a known or suspected deficiency of CYP2D6 may be at higher risk of adverse effects.

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo specific studies in the elderly are available. However, elderly often have cardiovascular, pulmonary, and gastrointestinal diseases which may restrict or contraindicate the use of this agent. The use of saliva substitutes should be considered initially. Although the clinical studies included elderly patients (>65 years of age), the number of elderly was insufficient to determine any significant differences between young adults and elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use only if potential benefit justifies potential risk to the fetus.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Central nervous system: Headache (14%; placebo 20%)

Gastrointestinal: Nausea (14%), diarrhea (10%)

Respiratory: Rhinitis (11%), sinusitis (12%), upper respiratory infection (11%)

Miscellaneous: Diaphoresis increased (19%)

1% to 10%:

Cardiovascular: Peripheral edema, chest pain, edema, palpitation

Central nervous system: Dizziness (4%), fatigue (3%), pain (3%), insomnia (2%), anxiety (1%), fever, depression, migraine, hypoesthesia, vertigo

Dermatologic: Rash (4%; placebo 6%), pruritus, skin disorder, erythematous rash

Endocrine & metabolic: Hot flashes (2%)

Gastrointestinal: Dyspepsia (8%; placebo 9%), abdominal pain (8%), vomiting (5%), excessive salivation (2%), constipation, salivary gland pain, dry mouth, sialoadenitis, gastroesophageal reflux, flatulence, ulcerative stomatitis, eructation, amylase increased, anorexia, tooth disorder

Genitourinary: Urinary tract infection (6%), vaginitis, cystitis

Hematologic: Anemia

Local: Abscess

Neuromuscular & skeletal: Back pain (5%), arthralgia (4%), skeletal pain (3%), rigors (1%), hypertonia, tremor, myalgia, hyporeflexia, leg cramps

Ocular: Conjunctivitis (4%), abnormal vision, eye pain, eye abnormality, xerophthalmia

Otic: Earache, otitis media

Respiratory: Coughing (6%), bronchitis (4%), pneumonia, epistaxis

Miscellaneous: Flu-like syndrome, infection, fungal infection, allergy, hiccups

<1%: Abnormal ECG, abnormal renal function, aggressive behavior, agitation, alopecia, anemia, angina, anterior chamber hemorrhage, aphasia, apnea, arrhythmia, arthropathy, avascular necrosis (femoral head), blepharitis, bronchospasm, bullous eruption, bundle branch block, bursitis, cataract, cholelithiasis, cholinergic syndrome, coma, confusion, corneal ulceration, costochondritis, CPK increased, deafness, delirium, dementia, impotence, depersonalization, dermatitis, diplopia, dry skin, dyskinesia, dysphagia, dysphonia, dysuria, hematuria, eczema, electrolyte abnormality, emotional lability, enterocolitis, eosinophilia, epididymitis, esophageal stricture, esophagitis, fall, gastric ulcer, gastrointestinal hemorrhage, genital pruritus, gingival hyperplasia, glaucoma, granulocytopenia, hallucination, hyper-/hypotension, hyperkinesia, hypothyroidism, ileus, intestinal obstruction, leukocytosis, leukopenia, lymphadenopathy, lymphocytosis, malaise, manic reaction, melena, menstrual disorder, MI, motion sickness, mucositis, multiple sclerosis (aggravated), nasal ulcer, neuralgia, neuropathy, oliguria, paralysis, paranoia, paresthesia, parosmia, peptic ulcer, pericarditis, peripheral ischemia, photosensitivity reaction, pleural effusion, postural hypotension, pulmonary embolism, pulmonary fibrosis, renal calculus, retinal disorder, scleritis, seizure, sepsis, skin ulceration, somnolence, stomatitis, substernal chest pain, syncope, synovitis, systemic lupus erythematosus, taste perversion, tendonitis, tenosynovitis, thrombocytopenia, thrombocytopenic purpura, thrombophlebitis, tinnitus, tongue discoloration, tongue ulceration, transaminases increased, T-wave inversion, urinary retention, urine flow decreased, vasculitis

Postmarketing and/or case reports: Cholecystitis

Metabolism/Transport Effects**Substrate** (minor) of CYP2D6, CYP3A4
Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor for therapeutic effect and adverse reactions (especially with elderly persons). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.
Patient EducationTake exactly as directed; do not alter dosage without consulting prescriber. Take with or without food. You may experience decreased visual acuity, especially at night (use caution when driving at night or when engaging in other activities in poorly lighted areas until response to medication is known); GI distress or nausea (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); headache (mild analgesic may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report unresolved diarrhea or constipation, abdominal pain, flatulence, anorexia, or excessive salivation; excessive sweating; unresolved respiratory distress, runny nose, cold or flu symptoms; joint, bone, or muscle weakness, pain, tremor, or cramping; chest pain or palpitations, swelling of extremities, weight gain; or other persistent adverse symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 30 mg

Generic AvailableNo
ManufacturerDaiichi Pharmaceutical Corp
Pricing: U.S. (www.drugstore.com)

Capsules (Evoxac)

30 mg (30): $63.99

Mechanism of ActionBinds to muscarinic (cholinergic) receptors, causing an increase in secretion of exocrine glands (including salivary glands)

Pharmacodynamics/Kinetics

Distribution: V_d: 6 L/kg

Protein binding: <20%

Metabolism: Hepatic via CYP2D6 and CYP3A4

Half-life elimination: 5 hours

Time to peak: 1.5-2 hours

Excretion: Urine (as metabolites and unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Excessive salivation, salivary gland pain, xerostomia (normal salivary flow resumes upon discontinuation), ulcerative stomatitis, and tooth disorder.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, anxiety, and depression; rare reports of mania

Mental Health: Effects on Psychiatric TreatmentFluoxetine, nefazodone, and paroxetine may increase levels of cevimeline. TCAs, phenothiazine, clozapine, and olanzapine may antagonize the effects of cevimeline.

Index TermsCevimeline Hydrochloride

International Brand NamesEvoxac (JP)

Pharmacologic CategoryChemotherapy Regimen, Head and Neck Cancer

Regimen UseHead and neck cancer

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 3 or 4 weeks

Variation 2:

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 5

[total dose/cycle = 5000 mg/m^2]

Repeat cycle every 3 or 4 weeks

Variation 3:

Cisplatin: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

Fluorouracil: I.V.: 800 mg/m^2/day continuous infusion days 1 to 5

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 14 days

Variation 4:

Cisplatin: I.V.: 20 mg/m^2/day days 1 to 5

[total dose/cycle = 100 mg/m^2]

Fluorouracil: I.V.: 200 mg/m^2/day days 1 to 5

[total dose/cycle = 1000 mg/m^2]

Repeat cycle every 3 weeks

Variation 5:

Cisplatin: I.V.: 80 mg/m^2 continuous infusion day 1

[total dose/cycle = 80 mg/m^2]

Fluorouracil: I.V.: 800 mg/m^2/day continuous infusion days 2 to 6

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 3 weeks

Variation 6:

Cisplatin: I.V.: 75 mg/m^2 day 1

[total dose/cycle = 75 mg/m^2]

Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 4 weeks

Variation 7:

Cisplatin: I.V.: 120 mg/m^2 day 1

[total dose/cycle = 120 mg/m^2]

Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 5

[total dose/cycle = 5000 mg/m^2]

Repeat cycle every 3 weeks

Variation 8:

Cisplatin: I.V.: 25 mg/m^2/day continuous infusion days 1 to 4

[total dose/cycle = 100 mg/m^2]

Fluorouracil: I.V.: 1000 mg/m^2/day days 1 to 4

[total dose/cycle = 4000 mg/m^2]

Repeat cycle every 3 weeks

Variation 9:

Fluorouracil: I.V.: 350 mg/m^2/day continuous infusion days 1 to 5

[total dose/cycle = 1750 mg/m^2]

Cisplatin: I.V.: 50 mg/m^2 day 6

[total dose/cycle = 50 mg/m^2]

Repeat cycle every 3 weeks

Variation 10:

Cisplatin: I.V.: 5 mg/m^2/day continuous infusion days 1 to 14

[total dose/cycle = 70 mg/m^2]

Fluorouracil: I.V.: 200 mg/m^2/day continuous infusion days 1 to 14

[total dose/cycle = 2800 mg/m^2]

With concurrent radiation therapy, cycle does not repeat

CHAMOCA (Modified Bagshawe Regimen)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category Chemotherapy Regimen, Gestational Trophoblastic Tumor

Regimen Use Gestational trophoblastic tumor

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Hydroxyurea: Oral: 500 mg every 6 hours, for 4 doses, day 1 (start at 6 AM)

[total dose/cycle = 2000 mg]

Dactinomycin: I.V.: 0.2 mg/day days 1, 2, and 3 (give at 7 PM)

followed by I.V.: 0.5 mg/day days 4 and 5 (give at 7 PM)

[total dose/cycle = 1.6 mg]

Cyclophosphamide: I.V.: 500 mg/m^2/day days 3 and 8 (give at 7 PM)

[total dose/cycle = 1000 mg/m^2]

Vincristine: I.V.: 1 mg/m^2 (maximum 2 mg) day 2 (give at 7 AM)

[total dose/cycle = 1 mg/m^2; maximum 2 mg]

Methotrexate: I.V. bolus: 100 mg/m^2 day 2 (give at 7 PM)

followed by I.V.: 200 mg/m^2 continuous infusion over 12 hours day 2

[total dose/cycle = 300 mg/m^2]

Leucovorin: I.M.: 14 mg every 6 hours, for 6 doses, days 3, 4, and 5 (begin at 7 PM on day 3; start 24 hours after the start of methotrexate)

[total dose/cycle = 84 mg]

Doxorubicin: I.V.: 30 mg/m^2 day 8 (give at 7 PM)

[total dose/cycle = 30 mg/m^2]

Repeat cycle every 18 days or as toxicity permits (cycle may be repeated 10 days after last treatment)

Variation 2:

Hydroxyurea: Oral: 500 mg every 12 hours, for 4 doses, days 1 and 2 (usually started in early morning)

[total dose/cycle = 2000 mg]

Dactinomycin: I.V.: 10 mcg/kg/day days 5, 6, and 7

[total dose/cycle = 30 mcg/kg]

Vincristine: I.V.: 1 mg/m^2 day 3

[total dose/cycle = 1 mg/m^2]

Methotrexate: I.V. bolus: 100 mg/m^2 day 3

followed by I.V.: 200 mg/m^2 continuous infusion over 12 hours day 3

[total dose/cycle = 300 mg/m^2]

Leucovorin: I.M.: 10 mg/m^2 every 12 hours, for 4 doses, days 4 and 5 (start 24 hours after the start of methotrexate)

[total dose/cycle = 40 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 5

[total dose/cycle = 600 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 10

[total dose/cycle = 30 mg/m^2]

Repeat cycle every 3 weeks

Variation 3:

Hydroxyurea: Oral: 500 mg every 12 hours, for 4 doses, days 1 and 2 (usually started in early morning)

[total dose/cycle = 2000 mg/m^2]

Vincristine: I.V.: 1 mg/m^2 day 3

[total dose/cycle = 1 mg/m^2]

Methotrexate: I.V. bolus: 100 mg/m^2 day 3

followed by I.V.: 200 mg/m^{2}continuous infusion over 12 hours day 3

[total dose/cycle = 300 mg/m^2]

Leucovorin: I.M.: 14 mg every 6 hours, for 6 doses, days 4, 5, and 6 (start 24 hours after start of methotrexate)

[total dose/cycle = 84 mg]

Dactinomycin: I.V.: 0.2 mg/day days 2, 3, and 4

followed by I.V.: 0.5 mg/day days 5 and 6

[total dose/cycle = 1.6 mg]

Cyclophosphamide: I.V.: 500 mg/m^2 day 4

[total dose/cycle = 500 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 9

[total dose/cycle = 30 mg/m^2]

Melphalan: I.V.: 6 mg/m^2 day 9

[total dose/cycle = 6 mg/m^2]

Repeat cycle approximately every 3 weeks

Variation 4:

Hydroxyurea: Oral: 500 mg 4 times/day, for 4 doses, day 1

[total dose/cycle = 2000 mg/m^2]

Vincristine: I.V.: 1 mg/m^2 day 2

[total dose/cycle = 1 mg/m^2]

Methotrexate: I.V. bolus: 100 mg/m^2 day 2

followed by I.V.: 200 mg/m^2 continuous infusion over 12 hours day 2

[total dose/cycle = 300 mg/m^2]

Leucovorin: I.M.: 14 mg every 6 hours, for 6 doses, days 3, 4, and 5 (start 24 hours after the start of methotrexate)

[total dose/cycle = 84 mg]

Dactinomycin: I.V.: 0.2 mg days 1, 2, and 3, then 0.5 mg days 4 and 5

[total dose/cycle = 1.6 mg]

Cyclophosphamide: I.V.: 500 mg/m^2 day 3

[total dose/cycle = 500 mg/m^2]

Cyclophosphamide: I.V.: 300 mg/m^2 on day 8

[total dose/cycle = 300 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 8

[total dose/cycle = 30 mg/m^2]

Repeat cycle approximately every 3 weeks

Charcoal, Activated

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Actidose® may be confused with Actos®

Pronunciation(CHAR kole AK tiv ay ted)

U.S. Brand NamesActidose-Aqua® [OTC]; Actidose® with Sorbitol [OTC]; Char-Caps [OTC]; CharcoAid® G [OTC]; Charcoal Plus® DS [OTC]; CharcoCaps® [OTC]; EZ-Char™ [OTC]; Kerr Insta-Char® [OTC]; Requa® Activated Charcoal [OTC]

Canadian Brand NamesCharcadole®; Charcadole® TFS; Charcadole®, Aqueous

Pharmacologic CategoryAntidote

Use: Labeled IndicationsEmergency treatment in poisoning by drugs and chemicals; aids the elimination of certain drugs and improves decontamination of excessive ingestions of sustained-release products or in the presence of bezoars; repetitive doses have proven useful to enhance the elimination of certain drugs (eg, carbamazepine, dapsone, phenobarbital, quinine, or theophylline); repetitive doses for gastric dialysis in uremia to adsorb various waste products; dietary supplement (digestive aid)

Dosing: Adults

Acute poisoning:

Oral: 25-100 g as a single dose; if multiple doses are needed, additional doses may be given as 12.5 g/hour or equivalent (eg, 25 g every 2 hours)

Note: ~10 g of activated charcoal for each 1 g of toxin is considered adequate; this may require multiple doses. If sorbitol is also used, sorbitol dose should not exceed 1.5 g/kg. When using multiple doses of charcoal, sorbitol should be given with every other dose (not to exceed 2 doses/day)

Dietary supplement: Oral: 500-520 mg after meals; may repeat in 2 hours if needed (maximum: 10 g/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Acute poisoning: Oral:

Children:

<1 year: 0.5-1 g/kg (10-25 g) as a single dose; if multiple doses are needed, give as 0.25 g/kg/hour or equivalent (eg, 0.5 g/kg every 2 hours)

1-12 years: 0.5-1 g/kg (25-50 g) as a single dose; if multiple doses are needed, give as 0.25 g/kg/hour or equivalent (eg, 0.5 g/kg every 2 hours)

>12 years: Refer to adult dosing.

Note: ~10 g of activated charcoal for each 1 g of toxin is considered adequate; this may require multiple doses. If sorbitol is also used, sorbitol dose should not exceed 1.5 g/kg. When using multiple doses of charcoal, sorbitol should be given with every other dose (not to exceed 2 doses/day).

Administration: OralFlavoring agents (eg, chocolate, concentrated fruit juice) or thickening agents (eg, bentonite, carboxymethylcellulose) can enhance charcoal's palatability. If treatment includes ipecac syrup, induce vomiting prior to administration of charcoal. Often given with a laxative or cathartic; check for presence of bowel sounds before administration. I.V. antiemetics may be required to reduce the risk of vomiting during multiple-dose therapy with charcoal.

StorageAdsorbs gases from air, store in closed container.

ReconstitutionPowder: Dilute with at least 8 mL of water per 1 g of charcoal, or mix in a charcoal to water ratio of 1:4 to 1:8. Mix to form a slurry.

ContraindicationsHypersensitivity to charcoal or any component of the formulation; intestinal obstruction; GI tract not anatomically intact; patients at risk of hemorrhage or GI perforation; patients with an unprotected airway (eg, CNS depression without intubation); if use would increase risk and severity of aspiration

Warnings/Precautions

Concerns related to adverse effects:

- Vomiting: Charcoal may cause vomiting; avoid use in hydrocarbon and caustic ingestions.

Disease-related concerns:

- Decreased peristalsis: Use with caution in patients with decreased peristalsis.

Concurrent drug therapy issues:

- Ipecac: When using ipecac with charcoal, ensure ipecac-induced vomiting has ceased prior to administering charcoal.
- Cathartics (eg, sorbitol, mannitol, magnesium sulfate): Coadministration of a cathartic is not recommended secondary to lack of compelling evidence and the increased morbidity associated with their use. If charcoal is administered with a cathartic, avoid excessive fluid and electrolyte losses, especially in children <1 year of age.

Special populations:

- Pediatrics: Charcoal with sorbitol not recommended in children <1 year of age.

Dosage form specific issues:

- Propylene glycol: Commercial charcoal products may contain propylene glycol.

Other warnings/precautions:

- Appropriate use: Not effective for cyanide, mineral acids, caustic alkalis, organic solvents, iron, ethanol, methanol, or lithium poisoning
- Efficacy: Most effective when administered within 30-60 minutes of ingestion.

Pregnancy Risk FactorC
LactationDoes not enter breast milk/compatible
Adverse ReactionsFrequency not defined.

Endocrine & metabolic: Hypernatremia, hypokalemia, and hypermagnesemia may occur with coadministration of cathartics

Gastrointestinal: Vomiting (incidence may increase with sorbitol), diarrhea (with sorbitol), constipation, swelling of abdomen, bowel obstruction, appendicitis

Respiratory: Aspiration (both gastric contents and charcoal)

Miscellaneous: Fecal discoloration (black)

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsFood: Do not mix with milk, ice cream, sherbet, or marmalade (may reduce charcoal's effectiveness).
Nursing: Physical Assessment/MonitoringMonitor for active bowel sounds prior to administration. If antidote treatment includes ipecac syrup, induce vomiting before administering charcoal. May be administered with sorbitol or chocolate to improve palatability; do not administer with milk products.
Patient EducationCharcoal will cause your stools to turn black. Do not self-administer as an antidote before calling the poison control center, hospital emergency room, or prescriber for instructions (charcoal is not the antidote for all poisons). **Pregnancy precaution:** Inform prescriber if you are pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Char-Caps, CharcoCaps®: 260 mg

Pellets, for suspension:

EZ-Char™: 25 g

Powder for suspension: 30 g, 240 g

CharcoAid® G: 15 g

Suspension:

Actidose-Aqua®: 15 g (72 mL); 25 g (120 mL); 50 g (240 mL)

Kerr Insta-Char®: 25 g (120 mL) [contains sodium benzoate; packaged with cherry flavor (cherry flavor contains propylene glycol and sodium benzoate)]; 50 g (240 mL) [contains sodium benzoate; unflavored or packaged with cherry flavor (cherry flavor contains propylene glycol and sodium benzoate)]

Suspension [with sorbitol]:

Actidose® with Sorbitol: 25 g (120 mL); 50 g (240 mL)

Kerr Insta-Char®: 25 g (120 mL) [contains sodium benzoate; packaged with cherry flavor (cherry flavor contains propylene glycol and sodium benzoate)]; 50 g (240 mL) [contains sodium benzoate; packaged with cherry flavor (cherry flavor contains propylene glycol and sodium benzoate)]

Tablet:

Requa® Activated Charcoal: 250 mg

Tablet, enteric coated:

Charcoal Plus® DS: 250 mg

Generic AvailableYes: Powder

Mechanism of ActionAdsorbs toxic substances or irritants, thus inhibiting GI absorption; adsorbs intestinal gas; the addition of sorbitol results in hyperosmotic laxative action causing catharsis

Pharmacodynamics/KineticsExcretion: Feces (as charcoal)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentDoes not effectively remove lithium

Index TermsActivated Carbon; Activated Charcoal; Adsorbent Charcoal; Liquid Antidote; Medicinal Carbon; Medicinal Charcoal

Chloral Hydrate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(KLOR al HYE drate)
U.S. Brand NamesAquachloral® Supprettes® [DSC]; Somnote®
Canadian Brand NamesPMS-Chloral Hydrate
Pharmacologic CategoryHypnotic, Nonbenzodiazepine
Use: Labeled IndicationsShort-term sedative and hypnotic (<2 weeks); sedative/hypnotic for diagnostic procedures; sedative prior to EEG evaluations
Use: DentalShort-term sedative/hypnotic for dental procedures
Dosing: Adults

Sedation, anxiety: Oral, rectal: 250 mg 3 times/day

Hypnotic: Oral, rectal: 500-1000 mg at bedtime or 30 minutes prior to procedure, not to exceed 2 g/24 hours

Discontinuation: Withdraw gradually over 2 weeks if patient has been maintained on high doses for prolonged period of time. Do not stop drug abruptly; sudden withdrawal may result in delirium.

Dosing: ElderlyHypnotic: Initial: Oral: 250 mg at bedtime; adjust for renal impairment. See Geriatric Considerations.
Dosing: Pediatric

Sedation, anxiety: Oral, rectal: 5-15 mg/kg/dose every 8 hours, maximum: 500 mg/dose

Prior to EEG: Oral, rectal: 20-25 mg/kg/dose, 30-60 minutes prior to EEG; may repeat in 30 minutes to maximum of 100 mg/kg or 2 g total

Hypnotic: Oral, rectal: 20-40 mg/kg/dose up to a maximum of 50 mg/kg/24 hours or 1 g/dose or 2 g/24 hours

Conscious sedation: Oral: 50-75 mg/kg/dose 30-60 minutes prior to procedure; may repeat 30 minutes after initial dose if needed, to a total maximum dose of 120 mg/kg or 1 g total

Discontinuation: Withdraw gradually over 2 weeks if patient has been maintained on high doses for prolonged period of time. Do not stop drug abruptly; sudden withdrawal may result in delirium.

Dosing: Renal Impairment

Cl_{cr} <50 mL/minute: Avoid use.

Hemodialysis effects: Supplemental dose is not necessary; dialyzable (50% to 100%).

Dosing: Hepatic ImpairmentAvoid use in patients with severe hepatic impairment.
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralChilling the syrup may help to mask unpleasant taste. Do not crush capsule (contains drug in liquid form). Gastric irritation may be minimized by diluting dose in water or other oral liquid.
StorageSensitive to light. Exposure to air causes volatilization. Store in light-resistant, airtight container.
RestrictionsC-IV
ContraindicationsHypersensitivity to chloral hydrate or any component of the formulation; hepatic or renal impairment; gastritis or ulcers; severe cardiac disease
Allergy Considerations

- Chloral Hydrate Allergy

Warnings/Precautions

Disease-related concerns:

- Porphyria: Use with caution in patients with porphyria.

Special populations:

- Elderly: Considered a second line hypnotic agent in the elderly.

- Long-term care facility residents: Recent interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) discourage the use of chloral hydrate in residents of long-term care facilities.

- Neonates: Use with caution in neonates; drug may accumulate with repeated use and prolonged use in neonates associated with hyperbilirubinemia.

Other warnings/precautions:

- Duration of therapy: Tolerance to hypnotic effect develops, therefore, not recommended for use >2 weeks.

- Metabolite: Trichloroethanol (TCE), a metabolite of chloral hydrate, is a carcinogen in mice; there is no data in humans.

- Withdrawal: Abrupt discontinuance may lead to withdrawal symptoms.

Geriatric ConsiderationsChloral hydrate is considered a second- or third-line hypnotic agent in the elderly. Interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) discourage the use of chloral hydrate in residents of long-term care facilities.
Pregnancy Risk FactorC
LactationEnters breast milk/compatible
Adverse ReactionsFrequency not defined.

Central nervous system: Ataxia, disorientation, sedation, excitement (paradoxical), dizziness, fever, headache, confusion, lightheadedness, nightmares, hallucinations, drowsiness, “hangover” effect

Dermatologic: Rash, urticaria

Gastrointestinal: Gastric irritation, nausea, vomiting, diarrhea, flatulence

Hematologic: Leukopenia, eosinophilia, acute intermittent porphyria

Miscellaneous: Physical and psychological dependence may occur with prolonged use of large doses

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Flumazenil: May diminish the sedative effect of Hypnotics (Nonbenzodiazepine). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsFalse-positive urine glucose using Clinitest® method; may interfere with fluorometric urine catecholamine and urinary 17-hydroxycorticosteroid tests
Monitoring ParametersVital signs, O_2 saturation and blood pressure with doses used for conscious sedation
Nursing: Physical Assessment/MonitoringFor short-term use. Assess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Monitor for excessive sedation. Evaluate periodically for need for continued use (symptoms of dependence may resemble alcoholism, but usually there is more gastritis). After long-term use, taper dosage slowly when discontinuing. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor for effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue this medication without consulting prescriber. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, unpleasant taste (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (buttermilk, boiled milk, yogurt may help). Report skin rash or irritation, CNS changes (confusion, depression, increased sedation, excitation, headache, insomnia, or nightmares), unresolved GI distress, chest pain or palpitations, or ineffectiveness of medication. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Somnote®: 500 mg

Suppository, rectal: 500 mg

Aquachloral® Supprettes®: 325 mg [contains tartrazine] [DSC]

Syrup: 500 mg/5 mL (5 mL, 480 mL)

Generic AvailableYes: Syrup and suppositories
Pricing: U.S. (www.drugstore.com)

Capsules (Somnote)

500 mg (50): $79.99

Syrup (Chloral Hydrate)

500 mg/5 mL (480): $19.97

Mechanism of ActionCentral nervous system depressant effects are due to its active metabolite trichloroethanol, mechanism unknown
Pharmacodynamics/Kinetics

Onset of action: Time to sleep: 0.5-1 hour

Duration: 4-8 hours

Absorption: Oral, rectal: Well absorbed

Distribution: Crosses placenta; negligible amounts enter breast milk

Metabolism: Rapidly hepatic to trichloroethanol (active metabolite); variable amounts hepatically and renally to trichloroacetic acid (inactive)

Half-life elimination: Active metabolite: 8-11 hours

Excretion: Urine (as metabolites); feces (small amounts)

Related Information

- CMS: Long-Term Care Facility Thresholds
- Depression
- Nonbenzodiazepine Anxiolytics and Hypnotics

Pharmacotherapy PearlsNot an analgesic
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Index TermsChloral; Hydrated Chloral; Trichloroacetaldehyde Monohydrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Chlorambucil may be confused with Chloromycetin®

Leukeran® may be confused with Alkeran®, leucovorin, Leukine®, Myleran®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(klor AM byoo sil)

U.S. Brand NamesLeukeran®

Canadian Brand NamesLeukeran®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent

Use: Labeled IndicationsManagement of chronic lymphocytic leukemia (CLL), Hodgkin's lymphoma, non-Hodgkin's lymphoma (NHL)

Use: Unlabeled/InvestigationalNephrotic syndrome, Waldenström's macroglobulinemia

Dosing: AdultsRefer to individual protocols.

CLL, NHL: Oral: 0.1 mg/kg/day for 3-6 weeks **or** 0.4 mg/kg (increased by 0.1mg/kg/dose until response/toxicity observed) biweekly **or** 0.4 mg/kg (increased by 0.1mg/kg/dose until response/toxicity observed) monthly **or** 0.03-0.1 mg/kg/day continuously

Hodgkin's lymphoma: Oral: 0.2 mg/kg/day for 3-6 weeks **or** 0.4 mg/kg (increased by 0.1mg/kg/dose until response/toxicity observed) biweekly **or** 0.4 mg/kg (increased by 0.1mg/kg/dose until response/toxicity observed) monthly **or** 0.03-0.1 mg/kg/day continuously

Waldenström's macroglobulinemia (unlabeled use): Oral: 0.1 mg/kg/day (continuously) for at least 6 months **or** 0.3 mg/kg/day for 7 days every 6 weeks for at least 6 months

Dosing: Elderly

Refer to adult dosing. Begin at the lower end of dosing range(s)

Dosing: PediatricRefer to individual protocols. Unlabeled uses:

General short courses: Oral: 0.1-0.2 mg/kg/day for 3-6 weeks **or** maintenance therapy: 0.03-0.1 mg/kg/day

Nephrotic syndrome: Oral: 0.1-0.2 mg/kg/day every day for ~8-12 weeks with low-dose prednisone

Chronic lymphocytic leukemia (CLL): Oral:

Biweekly regimen: Initial: 0.4 mg/kg/dose every 2 weeks; increase dose by 0.1 mg/kg every 2 weeks until a response occurs and/or myelosuppression occurs

Monthly regimen: Initial: 0.4 mg/kg, increase dose by 0.1 mg/kg every 4 weeks until a response occurs and/or myelosuppression occurs

Malignant lymphomas:

Non-Hodgkin's lymphoma: 0.1 mg/kg/day

Hodgkin's lymphoma: 0.2 mg/kg/day

Dosing: Renal ImpairmentThe FDA-appproved labeling does not contain renal dosing adjustment guidelines. The following guidelines have been used by some clinicians (Aronoff, 2007): Adults:

Cl_{cr} 10-50 mL/minute: Administer 75% of dose

Cl_{cr} <10 mL/minute: Administer 50% of dose

Continuous ambulatory peritoneal dialysis (CAPD): Administer 50% of dose

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain hepatic dosing adjustment guidelines. Chlorambucil is hepatically metabolized into active and inactive metabolites; dosage adjustment may be needed in patients with hepatic impairment.

Dosing: Adjustment for Toxicity
Skin reactions: Discontinue treatment

Hematologic: Persistent neutropenia, thrombocytopenia, and/or lymphocytosis: Do not exceed 0.1 mg/kg/day

Concurrent or within 4 weeks of chemotherapy/radiotherapy: Initiate treatment cautiously; reduce dose; monitor closely. (May use the usual dose if radiation therapy is small doses of palliative radiation over isolated foci remote from bone marrow.)

Dosing: Combination Regimens

Leukemia, chronic lymphocytic:

CHL + PRED

CP (Leukemia)

Lymphoma, Hodgkin's disease:

ChlVPP

LOPP

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: OralUsually administered as a single dose; preferably on an empty stomach.

StorageStore in refrigerator at 2°C to 8°C (36°F to 46°F). Protect from light.

Extemporaneously PreparedA 2 mg/mL oral suspension can be prepared by crushing sixty 2 mg tablets in a mortar and then mixing in small amounts of methylcellulose (mix in a total of 30 mL of methylcellulose). Next, add a sufficient quantity of syrup to make 60 mL of final product. Transfer to amber container. Label “shake well,” “refrigerate,” and “protect from light.” Refrigerated stability is 7 days.

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 4th ed, Cincinnati, OH: Harvey Whitney Books Co, 2000.

Dressman JB and Poust RI, “Stability of Allopurinol and of Five Antineoplastics in Suspension,” *Am J Hosp Pharm*, 1983, 40(4):616-8.

ContraindicationsHypersensitivity to chlorambucil or any component of the formulation; hypersensitivity to other alkylating agents (may have cross-hypersensitivity); pregnancy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Fertility effects: See “Concerns related to adverse effects” below.
- Secondary malignancies: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: May cause bone marrow suppression;** reduce initial dosage if patient has received myelosuppressive or radiation therapy, or has a depressed baseline leukocyte or platelet count within the previous 4 weeks. Lymphopenia may occur.
- Fertility effects: **[U.S. Boxed Warning]: Affects human fertility; probably mutagenic and teratogenic as well;** chromosomal damage has been documented. Fertility effects (reversible and irreversible sterility) include azoospermia (when administered to prepubertal and pubertal males) and amenorrhea.
- Secondary malignancies: **[U.S. Boxed Warning]: Possibly carcinogenic;** acute myelocytic leukemia and secondary malignancies may be associated with chronic therapy.
- Seizures: Have been observed with use; patients with a history of nephrotic syndrome and high pulse doses are at higher risk of seizures.
- Skin reactions: Rare instances of severe skin reactions (eg, erythema multiforme, Stevens-Johnson syndrome) have been reported; discontinue if a reaction occurs.

Disease-related concerns:

- Seizure disorder: Use with caution in patients with a history of seizure disorder or head trauma; seizures have been observed.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Vaccines: Avoid administration of live vaccines to immunocompromised patients.

Geriatric ConsiderationsToxicity to immunosuppressives is increased in the elderly. Start with lowest recommended adult doses. Signs of infection, such as fever and rise in WBCs, may not occur. Lethargy and confusion may be more prominent signs of infection.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity. Chlorambucil crosses the human placenta. Following exposure during the first trimester, case reports have noted adverse renal effects (unilateral agenesis). There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant while receiving treatment. **[U.S. Boxed Warning]: Affects human fertility; probably mutagenic and teratogenic as well**; chromosomal damage has been documented. Fertility effects (reversible and irreversible sterility) include azoospermia (when administered to prepubertal and pubertal males) and amenorrhea.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsFrequency not always defined.

Central nervous system: Agitation (rare), ataxia (rare), confusion (rare), drug fever, focal/generalized seizure (rare), hallucinations (rare)

Dermatologic: Angioneurotic edema, erythema multiforme (rare), rash, skin hypersensitivity, Stevens-Johnson syndrome (rare), toxic epidermal necrolysis (rare), urticaria

Endocrine & metabolic: Amenorrhea, infertility, SIADH (rare)

Gastrointestinal: Diarrhea (infrequent), nausea (infrequent), oral ulceration (infrequent), vomiting (infrequent)

Genitourinary: Azoospermia, cystitis (sterile)

Hematologic: Neutropenia (25%; dose- and duration-related; onset: 3 weeks; recovery: 10 days after last dose), bone marrow failure (irreversible), bone marrow suppression, anemia, leukemia (secondary), leukopenia, lymphopenia, pancytopenia, thrombocytopenia

Hepatic: Hepatotoxicity, jaundice

Neuromuscular & skeletal: Flaccid paresis (rare), muscular twitching (rare), myoclonia (rare), peripheral neuropathy, tremor (rare)

Respiratory: Interstitial pneumonia, pulmonary fibrosis

Miscellaneous: Allergic reactions, malignancies (secondary)

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersLiver function tests, CBC with differential and platelets (weekly, with WBC monitored twice weekly during the first 3-6 weeks of treatment), serum uric acid

Nursing: Physical Assessment/MonitoringUse caution in presence of seizure disorder or bone marrow suppression. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hematologic myelosuppression, hypersensitivity rash, drug fever, seizures, gastrointestinal upset, hepatotoxicity) on a regular basis throughout therapy. Teach patient (or caregiver) proper use, necessity for contraception with sexually-active female patients, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLiver function tests, CBC with differential and platelets (weekly, with WBC monitored twice weekly during the first 3-6 weeks of treatment), serum uric acid

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid alcohol, acidic, spicy, or hot foods. May cause menstrual irregularities and/or sterility. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, good mouth care, chewing gum or sucking lozenges may help); or mouth sores (use soft toothbrush or cotton swab for oral care). Report CNS changes (agitation, confusion, hallucinations, seizures); easy bruising or bleeding; unusual rash; persistent nausea, vomiting, or mouth sores; menstrual irregularities; yellowing of skin or dark urine; respiratory difficulty; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for instruction on appropriate contraceptive measures if necessary or if you suspect you might be pregnant. This drug may cause severe fetal defects. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Leukeran®: 2 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Leukeran)

2 mg (30): $87.54

Mechanism of ActionInterferes with DNA replication and RNA transcription by alkylation and cross-linking the strands of DNA

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: V_d: 0.14-0.24 L/kg

Protein binding: ~99%

Metabolism: Hepatic; forms a major active metabolite (phenylacetic acid mustard) and inactive metabolites

Bioavailability: Reduced 10% to 20% with food

Half-life elimination: ~1.5 hours; Phenylacetic acid mustard: ~1.8 hours

Time to peak, plasma: Within 1 hour; Phenylacetic acid mustard: 1.2-2.6 hours

Excretion: Urine (15% to 60% primarily as inactive metabolites, <1% as unchanged drug or phenylacetic acid mustard)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May rarely produce agitation, confusion, and hallucinations

Mental Health: Effects on Psychiatric Treatment Myelosuppression is common; use caution with clozapine and carbamazepine

Index TermsCB-1348; Chlorambucilum; Chloraminophene; Chlorbutinum; NSC-3088; WR-139013

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Chloromycetin® may be confused with chlorambucil, Chlor-Trimeton®

Pronunciation(klor am FEN i kole)

Canadian Brand NamesChloromycetin®; Chloromycetin® Succinate; Diochloram®; Pentamycetin®

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsTreatment of serious infections due to organisms resistant to other less toxic antibiotics or when its penetrability into the site of infection is clinically superior to other antibiotics to which the organism is sensitive; useful in infections caused by *Bacteroides*, *H. influenzae*, *Neisseria meningitidis*, *Salmonella*, and *Rickettsia*; active against many vancomycin-resistant enterococci

Dosing: AdultsSystemic infections: I.V.: 50-100 mg/kg/day in divided doses every 6 hours; maximum daily dose: 4 g/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Other infections:

Neonates: Initial loading dose: I.V. (I.M. administration is not recommended): 20 mg/kg (the first maintenance dose should be given 12 hours after the loading dose)

Maintenance dose: Postnatal age:

≤7 days: 25 mg/kg/day once every 24 hours

>7 days, ≤2000 g: 25 mg/kg/day once every 24 hours

>7 days, >2000 g: 50 mg/kg/day divided every 12 hours

Children: Usual dosing range: I.V.: 50-100 mg/kg/day in divided doses every 6 hours; maximum daily dose: 4 g/day

Meningitis: I.V.: Infants >30 days and Children: 75-100 mg/kg/day divided every 6 hours

Dosing: Renal ImpairmentUse with caution; monitor serum concentrations.

Dosing: Hepatic ImpairmentUse with caution; monitor serum concentrations.

Administration: I.V.Do not administer I.M.; can be administered IVP over at least 1 minute at a concentration of 100 mg/mL, or I.V. intermittent infusion over 15-30 minutes at a final concentration for administration of ≤20 mg/mL.

Administration: I.V. DetailpH: 6.4-7.0

Dietary ConsiderationsMay have increased dietary need for riboflavin, pyridoxine, and vitamin B_{12}. Sodium content of 1 g injection: ~52 mg (2.25 mEq).

StorageStore at room temperature prior to reconstitution. Reconstituted solutions remain stable for 30 days. Use only clear solutions. Frozen solutions remain stable for 6 months.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, fat emulsion 10%, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Acyclovir, cyclophosphamide, enalaprilat, esmolol, foscarnet, hydromorphone, labetalol, magnesium sulfate, meperidine, morphine, perphenazine, tacrolimus. **Incompatible** Fluconazole.

Compatibility in syringe: Compatible: Ampicillin, diatrizoate meglumine and diatrizoate sodium, diatrizoate sodium, heparin, iohexol, iopamidol, iothalamate meglumine, ioxaglate meglumine and ioxaglate sodium, penicillin G sodium. **Incompatible:** Glycopyrrolate, metoclopramide.

Compatibility when admixed: Compatible: Amikacin, aminophylline, ascorbic acid injection, calcium chloride, calcium gluconate, colistimethate, corticotropin, cyanocobalamin, dimenhydrinate, dopamine, ephedrine, heparin, hydrocortisone sodium succinate, kanamycin, lidocaine, lincomycin, magnesium sulfate, metaraminol, methyldopate, methylprednisolone sodium succinate, metronidazole, metronidazole with sodium bicarbonate, nafcillin, oxacillin, oxytocin, penicillin G potassium, penicillin G sodium, pentobarbital, phenylephrine, phenylephrine with sodium bicarbonate, phytonadione, plasma protein fraction, potassium chloride, ranitidine, sodium bicarbonate, thiopental, verapamil. **Incompatible:** Chlorpromazine, hydroxyzine, phenytoin, polymyxin B sulfate, prochlorperazine edisylate, prochlorperazine mesylate, promethazine, vancomycin. **Variable (consult detailed reference):** Ascorbic acid injection, erythromycin lactobionate, promazine, vitamin B complex with C.

ContraindicationsHypersensitivity to chloramphenicol or any component of the formulation; treatment of trivial or viral infections; bacterial prophylaxis

Warnings/Precautions

Boxed warnings:

- Blood dyscrasias: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Blood dyscrasias: **[U.S. Boxed Warning]: Serious and fatal blood dyscrasias (aplastic anemia, hypoplastic anemia, thrombocytopenia, and granulocytopenia) have occurred after both short-term and prolonged therapy. Monitor CBC frequently in all patients;** discontinue if evidence of myelosuppression. Irreversible bone marrow suppression may occur weeks or months after therapy. Avoid repeated courses of treatment. Should not be used for minor infections or when less potentially toxic agents are effective.

- Gray syndrome: Characterized by circulatory collapse, cyanosis, acidosis, abdominal distention, myocardial depression, coma, and death. Reaction appears to be associated with serum levels ≥50 mcg/mL. May result from drug accumulation in patients with impaired hepatic or renal function.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; reduced dosage recommended.

- Renal impairment: Use with caution in patients with renal impairment

Special populations:

- Glucose 6-phosphate dehydrogenase deficiency: Use with caution in patients with glucose 6-phosphate dehydrogenase deficiency.

- Neonates: Use with caution in neonates; due to risk of gray syndrome.

Geriatric ConsiderationsChloramphenicol has not been studied in the elderly. It is not necessary to adjust the dose based upon the decrease in renal function associated with age. Chloramphenicol should be reserved for serious infections and the oral form avoided.

Pregnancy ConsiderationsChloramphenicol crosses the placenta producing cord concentrations approaching maternal serum concentrations. An increased risk of teratogenic effects has not been identified for chloramphenicol and there have been no reports of fetal harm related to use of chloramphenicol in pregnancy. "Gray Syndrome" has occurred in premature infants and newborns receiving chloramphenicol. In most cases, chloramphenicol was started during the first 48 hours of life, but it has also occurred in older patients after high doses. Symptoms began after 3-4 days of therapy, starting with abdominal distention and continuing to progressive pallid cyanosis, vasomotor collapse, irregular respiration, and death within a few hours of symptom onset. Stopping therapy can reverse the process and allow complete recovery. There is one case report of an infant with gray baby syndrome after *in utero* exposure to a single maternal dose during labor, followed by a 10-fold overdose of chloramphenicol in the first day of life. The extent of the contribution of the single dose given during labor is unknown. The manufacturer recommends caution if used in a pregnant patient near term or during labor.

LactationEnters breast milk/use with caution (AAP rates “of concern”)

Breast-Feeding ConsiderationsChloramphenicol is excreted in human milk in both the active form and as inactive metabolites. Chloramphenicol is well absorbed following oral administration; however, metabolism and excretion are highly variable in infants and children. The half-life is also significantly prolonged in low birth weight infants. There have been documented toxicities in neonates and preterm infants when chloramphenicol has been used at therapeutic doses. The manufacturer recommends caution if using chloramphenicol in a breast-feeding infant. The AAP considers chloramphenicol to be a drug "for which the effect on nursing infants is unknown but may be of concern." Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Chloramphenicol in Pregnacy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Confusion, delirium, depression, fever, headache

Dermatologic: Angioedema, rash, urticaria

Gastrointestinal: Diarrhea, enterocolitis, glossitis, nausea, stomatitis, vomiting

Hematologic: Aplastic anemia, bone marrow suppression, granulocytopenia, hypoplastic anemia, pancytopenia, thrombocytopenia

Ocular: Optic neuritis

Miscellaneous: Anaphylaxis, hypersensitivity reactions, Gray syndrome

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak), 3A4 (weak)

Drug Interactions

Anticonvulsants (Hydantoin): Chloramphenicol may decrease the metabolism of Anticonvulsants (Hydantoin). Anticonvulsants (Hydantoin) may decrease the serum concentration of Chloramphenicol. Increased chloramphenicol concentrations have also been seen. *Risk D: Consider therapy modification*

Barbiturates: Chloramphenicol may decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Cyanocobalamin: Chloramphenicol may diminish the therapeutic effect of Cyanocobalamin. The expected hematologic response for the treatment of anemia may be opposed. *Risk D: Consider therapy modification*

Rifampin: May increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Sulfonylureas: Chloramphenicol may decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: May decrease intestinal absorption of vitamin B_{12} may have increased dietary need for riboflavin, pyridoxine, and vitamin B_{12}.

Test InteractionsMay cause false-positive results in urine glucose tests when using cupric sulfate (Benedict's solution, Clinitest®).

Monitoring ParametersCBC with differential (baseline and every 2 days during therapy), periodic liver and renal function tests, serum drug concentration

Reference Range

Therapeutic levels:

Meningitis:

Peak: 15-25 mcg/mL; toxic concentration: >40 mcg/mL

Trough: 5-15 mcg/mL

Other infections:

Peak: 10-20 mcg/mL

Trough: 5-10 mcg/mL

Timing of serum samples: Draw levels 0.5-1.5 hours after completion of I.V. dose

Nursing: Physical Assessment/MonitoringAssess results of culture/sensitivity tests and patient's allergy history prior to beginning treatment. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests periodically during therapy. Observe closely for adverse reactions during and following therapy (eg, bone marrow depression or aplastic anemia [petechiae, sore throat, fatigue, unusual bleeding or bruising, abdominal or bone pain], circulatory collapse, CNS disturbances, opportunistic infection). Advise patients with diabetes about use of Clinitest® (may cause false-positive test). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (eg, CNS changes, opportunistic infection, aplastic anemia) may occur 3 weeks to 12 months after initial exposure to chloramphenicol.

Monitoring: Lab TestsCBC with differential (baseline and every 2 days during therapy), periodic liver and renal function, serum drug concentration; culture and sensitivity prior to initiating therapy

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion and you will be monitored during each infusion; report immediately unusual chest tightness, difficulty breathing or swallowing; itching or skin rash; back pain or acute headache; or redness, swelling, or pain at infusion site. You may experience a bitter taste during infusion, this will pass. If you have diabetes, drug may cause false test results with Clinitest® glucose monitoring; use alternative glucose monitoring. May cause nausea, vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent rash or diarrhea; pain, burning, or numbness of extremities; petechiae; sore throat; fatigue; unusual bleeding or bruising; vaginal itching or discharge; mouth sores; yellowing of skin or eyes; dark urine or stool discoloration (blue); CNS disturbances (nightmares, acute headache); lack of improvement or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1 g [contains sodium ~52 mg/g (2.25 mEq/g)]

Generic AvailableYes

Mechanism of ActionReversibly binds to 50S ribosomal subunits of susceptible organisms preventing amino acids from being transferred to growing peptide chains thus inhibiting protein synthesis

Pharmacodynamics/Kinetics

Distribution: To most tissues and body fluids

Chloramphenicol: V_d: 0.5-1 L/kg

Chloramphenicol succinate: V_d: 0.2-3.1 L/kg; decreased with hepatic or renal dysfunction

Protein binding: Chloramphenicol: ~60%; decreased with hepatic or renal dysfunction and in newborn infants

Metabolism:

Chloramphenicol: Hepatic to metabolites (inactive)

Chloramphenicol succinate: Hydrolyzed in the liver, kidney and lungs to chloramphenicol (active)

Bioavailability:

Chloramphenicol: Oral: ~80%

Chloramphenicol succinate: I.V.: ~70%; highly variable, dependant upon rate and extent of metabolism to chloramphenicol

Half-life elimination:

Normal renal function:

Chloramphenicol: Adults: ~4 hours; Children 4-6 hours; Infants: Significantly prolonged

Chloramphenicol succinate: Adults: ~3 hours

End-stage renal disease: Chloramphenicol: 3-7 hours

Hepatic disease: Prolonged

Excretion: Urine (~30% as unchanged chloramphenicol succinate in adults, 6% to 80% in children; 5% to 15% as chloramphenicol)

Chlordiazepoxide and Methscopolamine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Librax® formulation may be cause for confusion:

In November 2004, Valeant Pharmaceuticals licensed the Librax® trademark to Victory Pharmaceuticals. Subsequently, the product was reformulated to contain chlordiazepoxide and methscopolamine. In January 2006, Valeant Pharmaceuticals began redistributing the original formulation of Librax®, containing clidinium and chlordiazepoxide. Victory Pharmaceuticals has discontinued their product. **Note:** The formulation of Librax® distributed in Canada (Valeant Canada Ltd) always contained clidinium and chlordiazepoxide.

Pronunciation(klor dye az e POKS ide & meth skoe POL a meen)

U.S. Brand NamesLibrax® *[reformulation]* [DSC]

Pharmacologic CategoryAnticholinergic Agent; Benzodiazepine

Use: Labeled IndicationsAdjunctive treatment of peptic ulcer; treatment of irritable bowel syndrome, acute enterocolitis

Dosing: AdultsPeptic ulcer, irritable bowel syndrome, acute enterocolitis: Oral: 1-2 capsules 3-4 times/day; adjust dose based on individual response.

Dosing: ElderlyOral: Initial dose should not exceed 2 capsules/day; adjust dose as tolerated.

Administration: OralAdminister before meals and at bedtime. Do not abruptly discontinue after prolonged use; taper dose gradually.

Dietary ConsiderationsTake before meals.

StorageStore at room temperature of 15°C to 30˚C (59°F to 86˚F).

RestrictionsC-IV

ContraindicationsHypersensitivity to chlordiazepoxide, methscopolamine, or any component of the formulation; glaucoma; prostatic hyperplasia; benign bladder neck obstruction

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsDue to its long-acting metabolite, chlordiazepoxide is not considered a drug of choice in the elderly. The use of anticholinergic agents may cause problems with bladder emptying, constipation, or case confusion. This combination of benzodiazepine and anticholinergic agent may increase the risk of confusion.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSee individual agents.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsSee individual agents.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status, monitor for orthostasis; mental status

Nursing: Physical Assessment/MonitoringSee individual agent for Chlordiazepoxide.

Patient EducationSee individual agent for Chlordiazepoxide.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: Chlordiazepoxide hydrochloride 5 mg and methscopolamine nitrate 2.5 mg [DSC]

Generic AvailableNo

ManufacturerVictory Pharmaceuticals

Mechanism of ActionChlordiazepoxide binds to stereospecific benzodiazepine (BZD) binding sites on GABA (A) receptor complexes at several sites within the central nervous system, including the limbic system and reticular formation. BZDs enhance GABA-mediated chloride influx through GABA receptor channels, causing membrane hyperpolarization. The net neuroinhibitory effects result in the observed sedative, hypnotic, anxiolytic, and muscle relaxant properties.

Methscopolamine is a peripheral anticholinergic agent with limited ability to cross the blood-brain barrier and provides a peripheral blockade of muscarinic receptors. This agent reduces the volume and the total acid content of gastric secretions, inhibits salivation, and reduces gastrointestinal motility.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause dizziness, confusion, amnesia, and insomnia. May rarely be associated with paradoxical reactions that include hyperactive and aggressive behaviors.

Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropic agents may produce additive sedative and anticholinergic effects; enzyme inducers (carbamazepine) may decrease the therapeutic effects and inhibitors (nefazodone) may enhance therapeutic effects.

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Index TermsMethscopolamine Nitrate and Chlordiazepoxide Hydrochloride

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

ChlordiazePOXIDE may be confused with chlorproMAZINE

Librium® may be confused with Librax®

Pronunciation(klor dye az e POKS ide)

U.S. Brand NamesLibrium®

Canadian Brand NamesApo-Chlordiazepoxide®

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsManagement of anxiety disorder or for the short-term relief of symptoms of anxiety; withdrawal symptoms of acute alcoholism; preoperative apprehension and anxiety

Dosing: Adults

Anxiety:

Oral: 15-100 mg divided 3-4 times/day

I.M., I.V.: Initial: 50-100 mg followed by 25-50 mg 3-4 times/day as needed

Preoperative anxiety: I.M.: 50-100 mg prior to surgery

Ethanol withdrawal symptoms: Oral, I.V.: 50-100 mg to start, dose may be repeated in 2-4 hours as necessary to a maximum of 300 mg/24 hours

Note: Up to 300 mg may be given I.M. or I.V. during a 6-hour period, but not more than this in any 24-hour period.

Dosing: ElderlyAnxiety: Oral: 5 mg 2-4 times/day; adjust for renal impairment. Avoid use if possible. See Geriatric Considerations.

Dosing: PediatricAnxiety: Oral, I.M.:

<6 years: Not recommended

>6 years: 0.5 mg/kg/24 hours divided every 6-8 hours

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Administer 50% of dose.

Not dialyzable (0% to 5%)

Dosing: Hepatic ImpairmentAvoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Administer by deep I.M. injection slowly into the upper outer quadrant of the gluteus muscle. Use only the diluent provided for I.M. use. Solutions made with SWFI or NS cause pain with I.M. administration.

Administration: I.V.Administer slowly over at least 1 minute. Do not use the diluent provided for I.M. use. Air bubbles form during reconstitution.

Administration: I.V. DetailRapid administration may cause symptoms of overdose.

pH: 2.5-3.5 (using I.M. diluent)

pH: 3 (using SWFI or NS as diluent)

StorageInjection: Prior to reconstitution, store under refrigeration and protect from light. Solution should be used immediately following reconstitution.

Reconstitution

I.M. use: Reconstitute by adding 2 mL of provided diluent; agitate gently until dissolved. Provided diluent is **not** for I.V. use.

I.V. use: Reconstitute by adding 5 mL NS or SWFI; agitate gently until dissolved; **do not administer this dilution I.M.**

CompatibilityStable in D_5W; **incompatible (consult detailed reference)** in Ringer's injection, NS.

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C. **Incompatible:** Cefepime.

RestrictionsC-IV

ContraindicationsHypersensitivity to chlordiazepoxide or any component of the formulation (cross-sensitivity with other benzodiazepines may also exist); narrow-angle glaucoma; pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Porphyria: Use with caution in patients with porphyria.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury. Active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.
- Pediatrics: Use with caution in children; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.

Dosage form specific issues:

- Injection: Parenteral administration should be avoided in comatose patients or shock. Adequate resuscitative equipment/personnel should be available, and appropriate monitoring should be conducted at the time of injection and for several hours following administration. The parenteral formulation should be diluted for I.M. administration with the supplied diluent only. This diluent should not be used when preparing the drug for intravenous administration.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsDue to its long-acting metabolite, chlordiazepoxide is not considered a drug of choice in the elderly. Long-acting benzodiazepines have been associated with falls in the elderly; interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) discourage the use of this agent in residents of long-term care facilities.

Pregnancy Risk FactorD

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsThere is no significant data for chlordiazepoxide, but a related compound, diazepam, has been shown to accumulate in nursing infants. It is recommended to discontinue nursing or the drug.

Adverse Reactions

>10%:

Central nervous system: Drowsiness, fatigue, ataxia, lightheadedness, memory impairment, dysarthria, irritability

Dermatologic: Rash

Endocrine & metabolic: Libido decreased, menstrual disorders

Gastrointestinal: Xerostomia, salivation decreased, appetite increased or decreased, weight gain/loss

Genitourinary: Micturition difficulties

1% to 10%:

Cardiovascular: Hypotension

Central nervous system: Confusion, dizziness, disinhibition, akathisia

Dermatologic: Dermatitis

Endocrine & metabolic: Libido increased

Gastrointestinal: Salivation increased

Genitourinary: Sexual dysfunction, incontinence

Neuromuscular & skeletal: Rigidity, tremor, muscle cramps

Otic: Tinnitus

Respiratory: Nasal congestion

<1%: Photosensitivity

Metabolism/Transport Effects **Substrate** of CYP3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Serum concentrations/effects may be increased with grapefruit juice, but unlikely because of high oral bioavailability of chlordiazepoxide.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status, mental status, check for orthostasis

Reference RangeTherapeutic: 0.1-3 mcg/mL (SI: 0-10 µmol/L); Toxic: >23 mcg/mL (SI: >77 µmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess for CNS depression. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. **I.V.:** Monitor vital signs frequently during infusion, observe safety precautions, and maintain bedrest for 2-3 hours following infusion.

Patient Education**Oral:** Take exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. Do not use alcohol or other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or altered sexual drive or ability (reversible). Report persistent CNS effects (eg, euphoria, confusion, increased sedation, depression); chest pain, palpitations, or rapid heartbeat; muscle cramping, weakness, tremors, rigidity, or altered gait; or worsening of condition. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 5 mg, 10 mg, 25 mg

Injection, powder for reconstitution, as hydrochloride: 100 mg [diluent contains benzyl alcohol, polysorbate 80, and propylene glycol]

Generic AvailableYes: Capsule

Pricing: U.S. (www.drugstore.com)

Capsules (Chlordiazepoxide HCl)

5 mg (60): $14.99

10 mg (60): $13.99

25 mg (60): $18.99

Capsules (Librium)

10 mg (60): $98.79

25 mg (30): $65.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Distribution: V_d: 3.3 L/kg; crosses placenta; enters breast milk

Protein binding: 90% to 98%

Metabolism: Extensively hepatic to desmethyldiazepam (active and long-acting)

Half-life elimination: 6.6-25 hours; End-stage renal disease: 5-30 hours; Cirrhosis: 30-63 hours

Time to peak, serum: Oral: Within 2 hours; I.M.: Results in lower peak plasma levels than oral

Excretion: Urine (minimal as unchanged drug)

Pharmacotherapy PearlsAbrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Chlordiazepoxide is poorly and erratically absorbed after I.M. administration; undergoes phase I metabolism. Chlordiazepoxide is a long half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle-relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Anesthesia and Critical Care Concerns/Other ConsiderationsChronic use of this agent may increase the perioperative benzodiazepine dose needed to achieve desired effect. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Medication Safety Issues

Sound-alike/look-alike issues:

Peridex® may be confused with Precedex™

Pronunciation(klor HEKS i deen GLOO koe nate)
U.S. Brand NamesAvagard™ [OTC]; BactoShield® CHG [OTC]; Betasept® [OTC]; ChloraPrep® Frepp® [OTC]; ChloraPrep® Sepp® [OTC]; ChloraPrep® [OTC]; Chlorascrub™ Maxi [OTC]; Chlorascrub™ [OTC]; Dyna-Hex® [OTC]; Hibiclens® [OTC]; Hibistat® [OTC]; Operand® Chlorhexidine Gluconate [OTC]; Peridex®; PerioChip®; PerioGard®
Canadian Brand NamesHibidil® 1:2000; ORO-Clense; Peridex® Oral Rinse
Pharmacologic CategoryAntibiotic, Oral Rinse; Antibiotic, Topical
Use: Labeled IndicationsSkin cleanser for surgical scrub, cleanser for skin wounds, preoperative skin preparation, germicidal hand rinse, and as antibacterial dental rinse. Chlorhexidine is active against gram-positive and gram-negative organisms, facultative anaerobes, aerobes, and yeast.

Orphan drug: Peridex®: Oral mucositis with cytoreductive therapy when used for patients undergoing bone marrow transplant

Use: Dental

Antibacterial dental rinse; chlorhexidine is active against gram-positive and gram-negative organisms, facultative anaerobes, aerobes, and yeast

Chip, for periodontal pocket insertion: Indicated as an adjunct to scaling and root planing procedures for reduction of pocket depth in patients with adult periodontitis; may be used as part of a periodontal maintenance program

Dosing: Adults

Oral rinse (Peridex®, PerioGard®):

Floss and brush teeth, completely rinse toothpaste from mouth and swish 15 mL (one capful) undiluted oral rinse around in mouth for 30 seconds, then expectorate. Caution patient not to swallow the medicine and instruct not to eat for 2-3 hours after treatment. (Cap on bottle measures 15 mL.)

Treatment of gingivitis: Oral prophylaxis: Swish for 30 seconds with 15 mL chlorhexidine, then expectorate; repeat twice daily (morning and evening). Patient should have a re-evaluation followed by a dental prophylaxis every 6 months.

Periodontal chip: One chip is inserted into a periodontal pocket with a probing pocket depth ≥5 mm. Up to 8 chips may be inserted in a single visit. Treatment is recommended every 3 months in pockets with a remaining depth ≥5 mm. If dislodgment occurs 7 days or more after placement, the subject is considered to have had the full course of treatment. If dislodgment occurs within 48 hours, a new chip should be inserted. The chip biodegrades completely and does not need to be removed. Patients should avoid dental floss at the site of PerioChip® insertion for 10 days after placement because flossing might dislodge the chip.

Insertion of periodontal chip: Pocket should be isolated and surrounding area dried prior to chip insertion. The chip should be grasped using forceps with the rounded edges away from the forceps. The chip should be inserted into the periodontal pocket to its maximum depth. It may be maneuvered into position using the tips of the forceps or a flat instrument.

Cleanser:

Surgical scrub: Scrub 3 minutes and rinse thoroughly, wash for an additional 3 minutes

Hand sanitizer (Avagard™): Dispense 1 pumpful in palm of one hand; dip fingertips of opposite hand into solution and work it under nails. Spread remainder evenly over hand and just above elbow, covering all surfaces. Repeat on other hand. Dispense another pumpful in each hand and reapply to each hand up to the wrist. Allow to dry before gloving.

Hand wash: Wash for 15 seconds and rinse

Hand rinse: Rub 15 seconds and rinse

Dosing: ElderlyRefer to adult dosing.
Administration: OralPeriodontal chip insertion: Pocket should be isolated and surrounding area dried prior to chip insertion. The chip should be grasped using forceps with the rounded edges away from the forceps. The chip should be inserted into the periodontal pocket to its maximum depth. It may be maneuvered into position using the tips of the forceps or a flat instrument. The chip biodegrades completely and does not need to be removed. Patients should avoid dental floss at the site of PerioChip® insertion for 10 days after placement because flossing might dislodge the chip.
Administration: TopicalKeep out of eyes, ears, and mouth. Do not routinely apply to wounds which involve more than superficial layers of skin. Avoid contact with meninges (do not use on lumbar puncture sites). Solutions may be flammable (contain isopropyl alcohol); avoid exposure to open flame and/or ignition source (eg, electrocautery) until completely dry; avoid application to hairy areas which may

significantly delay drying time.

Administration: OtherHand sanitizer (Avagard™): To facilitate drying, continue rubbing hand prep into hands until dry.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

Avagard™: Avoid excessive heat. Ethanol-containing products are flammable; keep away from flames or fire. Hand lotions and gel hand sanitizers are incompatible. The thickeners used in these products (eg, carbomer) react to form an insoluble salt and cause loss of antibacterial action.

ContraindicationsHypersensitivity to chlorhexidine gluconate or any component of the formulation

Warnings/Precautions

Dosage form specific issues:

- Oral: Staining of oral surfaces (mucosa, teeth, tooth restorations, dorsum of tongue) may occur; may be visible as soon as 1 week after therapy begins and is more pronounced when there is a heavy accumulation of unremoved plaque and when teeth fillings have rough surfaces. Stain does not have a clinically adverse effect, but because removal may not be possible, patient with frontal restoration should be advised of the potential permanency of the stain.

- Topical: For topical use only. Avoid application over large surfaces or into open wounds. Keep out of eyes and ears. May stain fabric. There have been case reports of anaphylaxis following chlorhexidine disinfection. Not for preoperative preparation of face or head; avoid contact with meninges (do not use on lumbar puncture sites). Solutions may be flammable (contain isopropyl alcohol); avoid exposure to open flame and/or ignition source (eg, electrocautery) until completely dry; avoid application to hairy areas which may significantly delay drying time. Avoid use in children <2 months of age due to increased absorption and/or irritation.

Pregnancy Risk FactorB

Adverse Reactions

Oral:

>10%: Tartar on teeth increased, taste changes. Staining of oral surfaces (mucosa, teeth, dorsum of tongue) may be visible as soon as 1 week after therapy begins and is more pronounced when there is a heavy accumulation of unremoved plaque and when teeth fillings have rough surfaces. Stain does not have a clinically adverse effect but because removal may not be possible, patient with frontal restoration should be advised of the potential permanency of the stain.

1% to 10%: Gastrointestinal: Tongue irritation, oral irritation

<1%: Facial edema, nasal congestion, dyspnea

Topical: Skin erythema and roughness, dryness, sensitization, allergic reactions

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Chip, for periodontal pocket insertion:

PerioChip®: 2.5 mg

Liquid, topical [surgical scrub]:

BactoShield® CHG: 2% (120 mL, 480 mL, 750 mL, 960 mL, 3840 mL); 4% (120 mL, 480 mL, 960 mL, 3840 mL) [contains isopropyl alcohol]

Betasept®: 4% (120 mL, 240 mL, 480 mL, 960 mL, 3840 mL) [contains isopropyl alcohol]

ChloraPrep®: 2% (0.67 mL, 1.5 mL, 3 mL, 10.5 mL, 26 mL) [contains isopropyl alcohol 70%; prefilled applicator]

Dyna-Hex®: 2% (120 mL, 480 mL, 960 mL, 3840 mL) [contains isopropyl alcohol]; 4% (120 mL, 480 mL, 960 mL, 3840 mL) [contains isopropyl alcohol]

Hibiclens®: 4% (15 mL, 120 mL, 240 mL, 480 mL, 960 mL, 3840 mL) [contains isopropyl alcohol]

Operand® Chlorhexidine Gluconate: 2% (120 mL); 4% (120 mL, 240 mL, 480 mL, 960 mL, 3840 mL) [contains isopropyl alcohol]

Liquid, oral [rinse]: 0.12% (480 mL)

Peridex®: 0.12% (120 mL, 480 mL, 1920 mL) [contains alcohol 11.6%; mint flavor]

PerioGard®: 0.12% (480 mL) [contains alcohol 11.6%; mint flavor]

Lotion, topical [surgical scrub]:

Avagard™: 1% (500 mL) [contains ethyl alcohol and moisturizers]

Sponge/Brush, topical:

BactoShield® CHG): 4% [contains isopropyl alcohol]

Sponge, topical [surgical scrub]:

ChloraPrep® 3 mL: 2% (25s) [contains isopropyl alcohol; available in clear or Hi-Lite Orange™]

ChloraPrep® 10.5 mL: 2% (25s) [contains isopropyl alcohol; available in clear, Hi-Lite Orange™, and Scrub Teal™]

ChloraPrep® 26 mL: 2% (25s) [contains isopropyl alcohol; available in clear, Hi-Lite Orange™, and Scrub Teal™]

ChloraPrep® Frepp® 1.5 mL: 2% (20s) [contains isopropyl alcohol]

ChloraPrep® Sepp® 0.67 mL: 2% (200s) [contains isopropyl alcohol]

Swab, topical [prep pad]:

Chlorascrub™: 3.15% (100s) [contains isopropyl alcohol]

Swabstick, topical [surgical scrub]:

ChloraPrep® 1.75 mL: 2% (48s) [contains isopropyl alcohol]

ChloraPrep® 5.25 mL: 2% (40s) [contains isopropyl alcohol]

Chlorascrub™ 1.6 mL: 3.15% (50s) [contains isopropyl alcohol]

Chlorascrub™ Maxi 5.1 mL: 3.15% (30s) [contains isopropyl alcohol]

Wipe, topical [towlette]:

Hibistat®: 0.5% (50s) [contains isopropyl alcohol]

Generic AvailableYes: Oral liquid

Pricing: U.S. (www.drugstore.com)

Solution (Chlorhexidine Gluconate)

0.12% (473): $22.00

Solution (Peridex)

0.12% (473): $23.99

Solution (Periogard)

0.12% (473): $15.99

Mechanism of ActionThe bactericidal effect of chlorhexidine is a result of the binding of this cationic molecule to negatively charged bacterial cell walls and extramicrobial complexes. At low concentrations, this causes an alteration of bacterial cell osmotic equilibrium and leakage of potassium and phosphorous resulting in a bacteriostatic effect. At high concentrations of chlorhexidine, the cytoplasmic contents of the bacterial cell precipitate and result in cell death.

Pharmacodynamics/Kinetics

Topical hand sanitizer (Avagard™): Duration of antimicrobial protection: 6 hours

Oral rinse (Peridex®, PerioGard®):

Absorption: ~30% retained in the oral cavity following rinsing and slowly released into oral fluids; poorly absorbed

Time to peak, plasma: Oral rinse: Detectable levels not present after 12 hours

Excretion: Feces (~90%); urine (<1%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Increased tartar on teeth, altered taste perception, staining of oral surfaces (mucosa, teeth, dorsum of tongue), and oral/tongue irritation. Staining may be visible as soon as 1 week after therapy begins and is more pronounced when there is a heavy accumulation of unremoved plaque and when teeth fillings have rough surfaces. Stain does not have a clinically adverse effect but because removal may not be possible, patient with frontal restoration should be advised of the potential permanency of the stain.

Papain-Containing Topical Products: FDA Enforcement Action - November 2008

In September 2008, the U.S. Food and Drug Administration (FDA) ordered companies to discontinue manufacturing papain-containing topical products by November 24, 2008, and to cease shipping of these products by January 21, 2009. At present, all topical products containing papain (~35 products under various trade names) lack FDA approval. Safety concerns have also been raised from reports of serious hypersensitivity reactions, including anaphylaxis, associated with papain use. Hypotension and tachycardia has also been observed in association with these hypersensitivity reactions. In addition, the medical literature also suggests that patients with latex hypersensitivity may also be allergic to papaya, the source of papain.

Papain-containing topical products manufactured prior to the ordered stop date may still be found on pharmacy shelves for a short period of time. However, healthcare providers are reminded that alternative products with FDA approval for the management of wounds are available.

Additional information may be found at http://www.fda.gov/cder/news/papain/qa.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Ziox™ may be confused with Zyvox®

Pronunciation(KLOR oh fil in, pa PAY in, & yoor EE a)

U.S. Brand NamesAllanfil 405; Allanfil Spray; Panafil®; Panafil® SE; Papfyll™; Ziox 405™; Ziox™

Pharmacologic CategoryEnzyme, Topical Debridement

Use: Labeled IndicationsTreatment of acute and chronic lesions, such as venous, diabetic, and decubitus ulcers, burns, postoperative wounds, pilonidal cyst wounds, carbuncles, and miscellaneous traumatic or infected wounds

Dosing: AdultsTopical: Apply with each dressing change; daily or twice daily dressing changes are preferred, but some products may be applied every 2-3 days. Cover with dressing following application.

Foam: Apply a single even layer

Ointment: Apply $^{1}/_{8}$” thickness over the wound with clean applicator.

Spray: Completely cover the wound site so that the wound is not visible.

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalCleanse wound prior to application. May apply under pressure dressings. Initially may require more frequent dressing changes to decrease irritation from enzymatic activity. Avoid cleansing with hydrogen peroxide solution. Avoid using heavy metal containing solutions (lead, mercury, silver). Do not use in or around the eyes.

Foam: Shake well before use. Prime pump (initial use only): Hold spray upright away from patient and depress actuator for 3-5 seconds or until foam begins to dispense. Normal use: Apply directly to wound or dressing; may hold spray at an angle or upright. Wipe actuator clean after each use.

Ointment: Apply directly to wound

Spray:

Panafil®: Shake well before use.

Panafil®, Panafil® SE: Prime pump (initial use only): Hold spray upright directly above the wound and prime the pump 6-8 times. Normal use: Allow a distance of 2-3 inches between the spray container and the wound; may hold spray at an angle or upright.

Storage

Foam: Store upright at room temperature of 15°C to 30°C (59°F to 86°F); do not freeze; protect from heat.

Ointment: Store at room temperature of 15°C to 30°C (59°F to 86°F).

Spray: Store upright at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to chlorophyllin, papain, urea, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Anaphylaxis and severe hypersensitivity reactions have occurred with papain use. Tachycardia and hypotension, in association with some hypersensitivity reactions, have also been observed.

- Latex hypersensitivity: Inconclusive data suggests a possible cross-sensitivity may exist between patients with natural rubber latex hypersensitivity and papaya, the source of papain.

Other warnings/precautions:

- Administration: For topical use only; not for use in eyes.

Geriatric ConsiderationsPreventive skin care should be instituted in all older patients at high risk for pressure ulcers.

Adverse ReactionsLocal: Burning sensation, skin irritation

Postmarketing and/or case reports: Anaphylaxis, hypersensitivity reactions

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy.

Patient EducationFor external use only. Skin should be cleansed prior to use. Hydrogen peroxide should not be used (may inactivate papain). Apply to entire wound area so that wound is not visible. Apply dressing (may use pressure dressings). Dressing changes are recommended once to twice daily. Do not use near eyes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, topical [foam]:

Papfyll™: Chlorophyllin copper complex sodium 0.5%, papain ≥520,000 USP units/g, and urea 10% (45 g)

Emulsion [spray]:

Panafil® SE: Chlorophyllin copper complex sodium 0.5%, papain ≥521,700 USP units/g, and urea 10% (34 mL)

Ointment:

Allanfil 405, Panafil®: Chlorophyllin copper complex sodium 0.5%, papain ≥521,700 USP units/g, and urea 10% (6 g, 30 g)

Ziox™: Chlorophyllin copper complex sodium 0.5%, papain ≥521,700 units/g, and urea 10% (30 g)

Ziox 405™: Chlorophyllin copper complex sodium 0.5%, papain ≥521,700 USP units/g, and urea 10% (30 g)

Solution [spray]:

Allanfil, Panafil® [DSC]: Chlorophyllin copper complex sodium 0.5%, papain ≥521,700 USP units/g, and urea 10% (33 mL)

Generic AvailableYes: Ointment, solution

Pricing: U.S. (www.drugstore.com)

Ointment (Panafil)

405900-10-0.5 (30): $82.99

Ointment (Ziox)

521.7-10-0.5 units/g-%-% (30): $44.96

Mechanism of Action

Papain: Potent digestant of nonviable protein matter; harmless to viable tissue. Requires activation to exert its function.

Urea: Exposes papain activators (sulfhydryl groups) and denatures nonviable protein matter making it more susceptible to enzymatic digestion.

Chlorophyllin copper complex sodium: Inhibits the hemagglutinating and inflammatory properties of protein degradation products in the wound; the resulting healthy granulation, decreased local inflammation, and decreased wound odor promotes wound healing.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Nesacaine® may be confused with Neptazane®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(klor oh PROE kane)

U.S. Brand NamesNesacaine®; Nesacaine®-MPF

Canadian Brand NamesNesacaine®-CE

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsInfiltration anesthesia and peripheral and epidural anesthesia

Dosing: AdultsDosage varies with anesthetic procedure, the area to be anesthetized, the vascularity of the tissues, depth of anesthesia required, degree of muscle relaxation required, and duration of anesthesia; range.

Maximum single dose (without epinephrine): 11 mg/kg; maximum dose: 800 mg

Maximum single dose (with epinephrine): 14 mg/kg; maximum dose: 1000 mg

Infiltration and peripheral nerve block:

Mandibular: 2%: 2-3 mL; total dose 40-60 mg

Infraorbital: 2%: 0.5-1 mL; total dose 10-20 mg

Brachial plexus: 2%; 30-40 mL; total dose 600-800 mg

Digital (without epinephrine): 1%; 3-4 mL; total dose: 30-40 mg

Pudendal: 2%; 10 mL each side; total dose: 400 mg

Paracervical: 1%; 3 mL per each of four sites

Caudal block: Preservative-free: 2% or 3%: 15-25 mL; may repeat at 40-60 minute intervals

Lumbar epidural block: Preservative-free: 2% or 3%: 2-2.5 mL per segment; usual total volume: 15-25 mL; may repeat with doses that are 2-6 mL less than initial dose every 40-50 minutes.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDosage varies with anesthetic procedure, the area to be anesthetized, the vascularity of the tissues, depth of anesthesia required, degree of muscle relaxation required, and duration of anesthesia; range.

Children >3 years (normally developed): Maximum dose (without epinephrine): 11 mg/kg; for infiltration, concentrations of 0.5% to 1% are recommended; for nerve block, concentrations of 1% to 1.5% are recommended

Administration: OtherBefore injecting, withdraw syringe plunger to ensure injection is not into vein or artery.

StorageStore at 15°C to 30°C (59°F to 86°F); protect from light and freezing. Discard Nesacaine®-MPF following single use.

ReconstitutionDilute with NS. To prepare 1:200,000 epinephrine-chloroprocaine HCl injection, add 0.1 mL of a 1:1000 epinephrine injection to 20 mL of preservative free chloroprocaine.

ContraindicationsHypersensitivity to chloroprocaine, other ester type anesthetics, or any component of the formulation; myasthenia gravis; do not use for subarachnoid administration

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.

- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.

- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease or compromised blood supply.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.

- Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.

- Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.

- Pediatrics: Use with caution in children; reduce dose consistent with age and physical status.

Dosage form specific issues:

- Preservative-containing solutions: **Do not use solutions containing preservatives for caudal or epidural block.**

Other warnings/precautions;

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.

- Test dose: A test dose is recommended prior to epidural administration (prior to initial dose) and all reinforcing doses with continuous catheter technique.

- Trained personnel: Clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Local anesthetics rapidly cross the placenta and may cause varying degrees of maternal, fetal, and neonatal toxicity. Close maternal and fetal monitoring (heart rate and electronic fetal monitoring advised) are required during obstetrical use. Maternal hypotension has resulted from regional anesthesia. Positioning the patient on her left side and elevating the legs may help. Epidural, paracervical, or pudendal anesthesia may alter the forces of parturition through changes in uterine contractility or maternal expulsive efforts. The use of some local anesthetic drugs during labor and delivery may diminish muscle strength and tone for the first day or two of life. Administration as a paracervical block is not recommended with toxemia of pregnancy, fetal distress, or prematurity. Administration of a paracervical block early in pregnancy has resulted in maternal seizures and cardiovascular collapse. Fetal bradycardia and acidosis also have been reported. Fetal depression has occurred following unintended fetal intracranial injection while administering a paracervical and/or pudendal block.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Frequency not defined.

Cardiovascular: Bradycardia, cardiac arrest, hypotension, ventricular arrhythmia

Central nervous system: Anxiety, dizziness, restlessness, tinnitus, unconsciousness

Dermatologic: Angioneurotic edema, erythema, pruritus, urticaria

Ocular: Blurred vision

Respiratory: Respiratory arrest

Miscellaneous: Allergic reactions, anaphylactoid reactions

<1%: Seizure (0.1%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCardiovascular and respiratory status; mental status

Nursing: Physical Assessment/MonitoringMonitor for effectiveness of anesthesia, and adverse reactions. Monitor for return of sensation. Teach patient adverse reactions to report; use and teach appropriate interventions to promote safety.

Patient EducationThis medication is given to reduce sensation in the injected area. You will experience decreased sensation to pain, heat, or cold in the area and/or decreased muscle strength (depending on area of application) until the effects wear off; use necessary caution to reduce incidence of possible injury until full sensation returns. Immediately report chest pain or palpitations; increased restlessness, confusion, anxiety, or dizziness; respiratory difficulty; chills, shivering, or tremors; ringing in ears; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride:

Nesacaine®: 1% (30 mL); 2% (30 mL) [contains disodium EDTA and methylparaben]

Injection, solution, as hydrochloride [preservative free]: 2% (20 mL); 3% (20 mL)

Nesacaine®-MPF: 2% (20 mL); 3% (20 mL)

Generic Available Yes

Mechanism of Action Chloroprocaine HCl is benzoic acid, 4-amino-2-chloro-2-(diethylamino) ethyl ester monohydrochloride. Chloroprocaine is an ester-type local anesthetic, which stabilizes the neuronal membranes and prevents initiation and transmission of nerve impulses thereby affecting local anesthetic actions. Local anesthetics including chloroprocaine, reversibly prevent generation and conduction of electrical impulses in neurons by decreasing the transient increase in permeability to sodium. The differential sensitivity generally depends on the size of the fiber; small fibers are more sensitive than larger fibers and require a longer period for recovery. Sensory pain fibers are usually blocked first, followed by fibers that transmit sensations of temperature, touch, and deep pressure. High concentrations block sympathetic somatic sensory and somatic motor fibers. The spread of anesthesia depends upon the distribution of the solution. This is primarily dependent on the volume of drug injected.

Pharmacodynamics/Kinetics

Onset of action: 6-12 minutes

Duration: 30-60 minutes

Distribution: V_d: Depends upon route of administration; high concentrations found in highly perfused organs such as liver, lungs, heart, and brain

Metabolism: Plasma cholinesterases

Excretion: Urine

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause anxiety, restlessness, and dizziness

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Chloroprocaine Hydrochloride

Pronunciation(KLOR oh kwin)

U.S. Brand NamesAralen®

Canadian Brand NamesAralen®; Novo-Chloroquine

Pharmacologic CategoryAminoquinoline (Antimalarial)

Use: Labeled IndicationsSuppression or chemoprophylaxis of malaria; treatment of uncomplicated or mild-to-moderate malaria; extraintestinal amebiasis

Use: Unlabeled/InvestigationalRheumatoid arthritis; discoid lupus erythematosus

Dosing: Adults

Malaria, suppression or prophylaxis: Oral: 500 mg/week (300 mg base) on the same day each week; begin 1-2 weeks prior to exposure; continue for 4-6 weeks after leaving endemic area; if suppressive therapy is not begun prior to exposure, double the initial loading dose to 1 g (600 mg base) and administer in 2 divided doses 6 hours apart, followed by the usual dosage regimen.

Malaria, acute attack: Oral: 1 g (600 mg base) on day 1, followed by 500 mg (300 mg base) 6 hours later, followed by 500 mg (300 mg base) on days 2 and 3.

Extraintestinal amebiasis: Oral: 1 g/day (600 mg base) for 2 days followed by 500 mg/day (300 mg base) for at least 2-3 weeks.

Rheumatoid arthritis, lupus erythematosus (unlabeled uses): Oral: 250 mg (150 mg base) once daily; reduce dosage following maximal response (taper to discontinue after response in lupus); generally requires 3-6 weeks. **Note:** Not considered first-line agent.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Malaria, suppression or prophylaxis: Oral: Administer 5 mg base/kg/week on the same day each week (not to exceed 300 mg base/dose); begin 1-2 weeks prior to exposure; continue for 4-6 weeks after leaving endemic area; if suppressive therapy is not begun prior to exposure, double the initial loading dose to 10 mg base/kg and administer in 2 divided doses 6 hours apart, followed by the usual dosage regimen

Malaria, acute attack: Oral: 10 mg/kg (base) on day 1, followed by 5 mg/kg (base) 6 hours later and 5 mg/kg (base) on days 2 and 3

Extraintestinal amebiasis: Oral: 10 mg/kg (base) once daily for 2-3 weeks (up to 300 mg base/day)

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Administer 50% of dose.

Hemodialysis effects: Minimally removed by hemodialysis

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralChloroquine phosphate tablets have also been mixed with chocolate syrup or enclosed in gelatin capsules to mask the bitter taste.

Dietary ConsiderationsMay be taken with meals to decrease GI upset.

StorageStore tablets at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedA 10 mg chloroquine base/mL suspension is made by pulverizing two Aralen® 500 mg phosphate = 300 mg base/tablet, levigating with sterile water, and adding by geometric proportion, a significant amount of the cherry syrup and levigating until a uniform mixture is obtained; qs ad to 60 mL with cherry syrup, stable for up to 4 weeks when stored in the refrigerator or at a temperature of 29°C

Mirochnick M, Barnett E, Clarke DF, et al, “Stability of Chloroquine in an Extemporaneously Prepared Suspension Stored at Three Temperatures,” *Pediatr Infect Dis J*, 1994, 13(9):827-8.

ContraindicationsHypersensitivity to chloroquine or any component of the formulation; retinal or visual field changes

Allergy Considerations

- QuiNIDine/QuiNINE Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular: Chloroquine has been associated with ECG changes, AV block, and cardiomyopathy (rare). Generally these are dose and/or duration dependent.
- Hematologic: Aminoquinolones have been associated with rare hematologic reactions including agranulocytosis, aplastic anemia, and thrombocytopenia; monitoring (CBC) is recommended in prolonged therapy.
- Neuromuscular: Myopathy, neuromyopathy, and progressive weakness have been reported with aminoquinolones (chloroquine); muscle strength (especially proximal muscles) should be assessed periodically during prolonged therapy.
- Ophthalmic effects: Retinopathy has occurred with chloroquine; effect is dose-related and may be reversible if detected early. Other effects include blurred vision or keratopathy. Monitoring is required.

Disease-related concerns:

- Auditory damage: Use with caution in patients with pre-existing auditory damage; discontinue immediately if hearing defects are noted.
- G6PD deficiency: Use with caution in patients with known G6PD; use of 4-aminoquinolines such as chloroquine has been associated with hemolysis and renal impairment in this population.
- Hepatic impairment: Use with caution in patients with hepatic impairment, alcoholism, or concurrent therapy with hepatotoxic agents.
- Porphyria: Use with caution in patients with porphyria; may exacerbate disease symptoms.
- Psoriasis: Use with caution in patients with psoriasis; may exacerbate disease symptoms.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using chloroquine during pregnancy. However, based on clinical experience and because malaria infection in pregnant women may be more severe than in nonpregnant women, chloroquine prophylaxis may be considered in areas of chloroquine-sensitive *P. falciparum* malaria. Pregnant women should be advised not to travel to areas of *P. falciparum* resistance to chloroquine.

LactationEnters breast milk/not recommended (AAP considers “compatible”)

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiomyopathy, ECG changes (rare; including T-wave inversion), hypotension (rare)

Central nervous system: Delirium, depression, fatigue, headache, personality changes, psychosis, seizure

Dermatologic: Pruritus, hair bleaching, pleomorphic skin eruptions, alopecia, lichen planus eruptions, alopecia, mucosal pigmentary changes (blue-black), photosensitivity

Gastrointestinal: Abdominal cramps, anorexia, diarrhea, nausea, stomatitis, vomiting

Hematologic: Agranulocytosis (reversible), aplastic anemia, neutropenia, thrombocytopenia

Neuromuscular & skeletal: Rare cases of myopathy, neuromyopathy, proximal muscle atrophy, and depression of deep tendon reflexes have been reported

Ocular: Blurred vision, retinopathy (including irreversible changes in some patients long-term or high-dose therapy)

Otic: Nerve deafness, tinnitus, hearing reduced (risk increased in patients with pre-existing auditory damage)

Metabolism/Transport Effects**Substrate** (major) of CYP2D6, 3A4; **Inhibits** CYP2D6 (moderate)

Drug Interactions

Anthelmintics: Aminoquinolines (Antimalarial) may decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Beta-Blockers: Aminoquinolines (Antimalarial) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoquinolines (Antimalarial) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Mefloquine: Aminoquinolines (Antimalarial) may enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Mefloquine may increase the serum concentration of Aminoquinolines (Antimalarial). Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of an aminoquinoline antimalarial when possible. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase GI irritation).

Monitoring ParametersOphthalmic exams at baseline and every 3 months during prolonged therapy. Visual acuity, slit-lamp, fundoscopic and visual field examination are recommended. Evaluate neuormuscular function during prolonged therapy. Periodic CBC in patients receiving prolonged therapy

Nursing: Physical Assessment/Monitoring Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests (CBC), therapeutic effectiveness (according to purpose for use), and adverse response (eg, retinopathy, hearing loss, myopathy) regularly during long-term therapy. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, anemia, muscle weakness, visual or auditory changes).

Monitoring: Lab TestsPeriodic CBC in prolonged therapy.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. It is important to complete full course of therapy, which may take up to 6 months for full effect. May be taken with meals to decrease GI upset and bitter aftertaste. Avoid alcohol. You should have regular ophthalmic exams (every 4-6 months) if using this medication over extended periods. May cause skin discoloration (blue/black), hair bleaching, or skin rash. If you have psoriasis, may cause exacerbation. May turn urine black/brown (normal). May cause headache (if persistent, consult prescriber for analgesic); nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or increased sensitivity to sunlight (wear dark glasses and protective clothing, use sunblock, and avoid direct exposure to sunlight). Report vision changes; rash or itching; persistent diarrhea or GI disturbances; change in hearing acuity or ringing in the ears; chest pain or palpitation; CNS changes; unusual fatigue, easy bruising or bleeding; or any other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as phosphate: 250 mg [equivalent to 150 mg base]; 500 mg [equivalent to 300 mg base]

Aralen®: 500 mg [equivalent to 300 mg base]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Aralen)

500 mg (25): $196.38

Tablets (Chloroquine Phosphate)

250 mg (30): $70.99

500 mg (7): $37.94

Mechanism of ActionBinds to and inhibits DNA and RNA polymerase; interferes with metabolism and hemoglobin utilization by parasites; inhibits prostaglandin effects; chloroquine concentrates within parasite acid vesicles and raises internal pH resulting in inhibition of parasite growth; may involve aggregates of ferriprotoporphyrin IX acting as chloroquine receptors causing membrane damage; may also interfere with nucleoprotein synthesis

Pharmacodynamics/Kinetics

Duration: Small amounts may be present in urine months following discontinuation of therapy

Absorption: Oral: Rapid (~89%)

Distribution: Widely in body tissues (eg, eyes, heart, kidneys, liver, lungs) where retention prolonged; crosses placenta; enters breast milk

Metabolism: Partially hepatic

Half-life elimination: 3-5 days

Time to peak, serum: 1-2 hours

Excretion: Urine (~70% as unchanged drug); acidification of urine increases elimination

Chlorothiazide

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

International issues:

Diuril® may be confused with Duorol® which is a brand name for acetaminophen in Spain

Pronunciation(klor oh THYE a zide)

U.S. Brand NamesDiuril®; Sodium Diuril®

Canadian Brand NamesDiuril®

Pharmacologic CategoryDiuretic, Thiazide

Use: Labeled IndicationsManagement of mild-to-moderate hypertension; adjunctive treatment of edema

Dosing: Adults**Note:** The manufacturer states that I.V. and oral dosing are equivalent. Some clinicians may use lower I.V. doses; however, because of chlorothiazide's poor oral absorption.

Hypertension: Oral: 500-2000 mg/day divided in 1-2 doses (manufacturer labeling); doses of 125-500 mg/day have also been recommended (JNC 7)

Edema: Oral, I.V.: 500-1000 mg once or twice daily; intermittent treatment (eg, therapy on alternative days) may be appropriate for some patients

ACC/AHA 2005 Heart Failure guidelines:

Oral: 250-500 mg once or twice daily (maximum daily dose: 1000 mg)

I.V.: 500-1000 mg once daily plus a loop diuretic

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** The manufacturer states that I.V. and oral dosing are equivalent. Some clinicians may use lower I.V. doses; however, because of chlorothiazide's poor oral absorption. I.V. dosing in infants and children has not been well established.

Infants <6 months:

Oral: 10-30 mg/kg/day in 2 divided doses (maximum dose: 375 mg/day); anecdotal reports have used up to 40 mg/kg/day (unlabeled).

I.V. (unlabeled): 2-8 mg/kg/day in 2 divided doses; anecdotal reports have used up to 20 mg/kg/day

Infants >6 months and Children:

Oral: 10-20 mg/kg/day in 1-2 divided doses (maximum dose: 375 mg/day in children <2 years or 1 g/day in children 2-12 years)

I.V. (unlabeled route): 4 mg/kg/day in 1-2 divided doses; anecdotal reports have used up to 20 mg/kg/day

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Avoid use. Ineffective with Cl_{cr} <30 mL/minute unless in combination with a loop diuretic (Aronoff, 2007)

Note: ACC/AHA 2005 Heart Failure Guidelines suggest that thiazides lose their efficacy when Cl_{cr} <40 mL/minute

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Do **not** administer injection via I.M. or SubQ route.

Administration: I.V. DetailAvoid extravasation of parenteral solution since it is extremely irritating to tissues.

pH: 9.2-10.0 (2.5% solution reconstituted with water for injection)

Dietary ConsiderationsMay need to decrease sodium and calcium, may need to increase potassium, zinc, magnesium, and riboflavin in diet. Sodium content of 500 mg injection: 57.5 mg (2 mEq).

Storage

Powder for injection: Prior to reconstitution, store between 2°C to 25°C (36°F to 77°F). Reconstituted solution is stable for 24 hours at room temperature; precipitation will occur in <24 hours in pH <7.4.

Suspension, tablets: Store at room temperature 15°C to 30°C (59°F to 86°F). Protect from freezing.

ReconstitutionPowder for injection: To reconstitute, add SWFI 18 mL to make 28 mg/mL. May be further diluted with dextrose or sodium chloride solutions. Single use only, discard any unused reconstituted solution.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, D_{10}NS, LR, ${}^1/_2$NS, NS.

Compatibility when admixed: Compatible: Cimetidine, lidocaine, nafcillin, ranitidine, sodium bicarbonate. **Incompatible:** Amikacin, chlorpromazine, hydralazine, insulin (regular), levorphanol, morphine, multivitamins, norepinephrine, polymyxin B sulfate, procaine, prochlorperazine edisylate, prochlorperazine mesylate, promazine, promethazine, streptomycin, triflupromazine, vancomycin.

ContraindicationsHypersensitivity to chlorothiazide, any component of the formulation, thiazides, or sulfonamide-derived drugs; anuria

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, hyponatremia, and hypomagnesemia can occur.
- Hypersensitivity reactions: Hypersensitivity reactions may occur.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with thiazide or sulfonamide allergy is specifically contraindicated in product labeling. A risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated.
- Hepatic impairment: Use with caution in patients with hepatic impairment; avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Hypokalemia: Use with caution in patients with hypokalemia; correct before initiating therapy.
- Renal impairment: Avoid in severe renal disease (ineffective). May precipitate azotemia; discontinue or consider withholding if renal impairment occurs.
- Systemic lupus erythematosus (SLE): Can cause SLE exacerbation or activation.

Geriatric ConsiderationsChlorothiazide is minimally effective in patients with a Cl_{cr} <30 mL/minute. This may limit the usefulness of chlorothiazide in the elderly.

Pregnancy Risk FactorC (manufacturer); D (expert analysis)

Pregnancy ConsiderationsCrosses the placenta. Hypoglycemia, thrombocytopenia, hemolytic anemia, electrolyte disturbances reported. May exhibit a tocolytic effect. Generally, use of diuretics during pregnancy is avoided for pregnancy-induced hypertension due to risk of decreased placental perfusion. Use may be considered in select patients with heart disease or chronic hypertension if started prior to gestation.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsCrosses into breast milk; may suppress lactation with high doses. AAP considers **compatible** with breast-feeding.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, orthostatic hypotension, necrotizing angiitis

Central nervous system: Dizziness, fever, headache, restlessness, vertigo

Dermatologic: Alopecia, erythema multiforme, exfoliative dermatitis, photosensitivity, purpura, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Cholesterol increased, hyperglycemia, hyperuricemia, hypochloremic alkalosis, hypokalemia, hyponatremia, hypomagnesemia, triglycerides increased

Gastrointestinal: Abdominal cramping, anorexia, constipation, diarrhea, gastric irritation, nausea, pancreatitis, sialadenitis, vomiting

Genitourinary: Impotence

Hematologic: Agranulocytosis, aplastic anemia, hemolytic anemia, leukopenia, thrombocytopenia

Hepatic: Jaundice

Neuromuscular & skeletal: Muscle spasm, paresthesia, weakness

Ocular: Blurred vision, xanthopsia

Renal: Glycosuria, hematuria (I.V.), interstitial nephritis, renal failure, renal dysfunction

Respiratory: Pneumonitis, pulmonary edema, respiratory distress

Miscellaneous: Anaphylactic reactions, systemic lupus erythematosus

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: May increase risk of orthostatic hypotension.

Food: Chlorothiazide serum levels may be increased if taken with food.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Test InteractionsIncreased creatine phosphokinase [CPK] (S), ammonia (B), amylase (S), calcium (S), chloride (S), cholesterol (S), glucose, increased acid (S), decreased chloride (S), magnesium, potassium (S), sodium (S); may interfere with tests for parathyroid function

Monitoring ParametersSerum electrolytes, renal function, blood pressure; assess weight, I & O reports daily to determine fluid loss

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, blood pressure, fluid status, and electrolyte balance) on a regular basis throughout therapy. Caution patients with diabetes to monitor glucose levels (may reduce effect of oral hypoglycemics). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor C/D:** See Pregnancy Risk Factor for use cautions; determine that patient is not pregnant before beginning treatment. Instruct patients of childbearing age about appropriate barrier contraceptive measures. Note breast-feeding caution.

Monitoring: Lab TestsSerum electrolytes, renal function

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take once-daily dose in morning or last of daily doses early in the day to avoid night-time disturbances. You may need to make dietary changes, follow dietary suggestions of prescriber. If using oral hypoglycemics, monitor glucose levels closely (this medication may reduce effect of oral hypoglycemics); contact prescriber with any major changes. May cause sensitivity to sunlight (use sunblock, wear protective clothing, and avoid direct sunlight); dizziness, weakness, or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or postural hypotension (use caution when rising from sitting or lying position or when climbing stairs). Report muscle twitching or cramps; acute loss of appetite; GI distress; severe rash, redness, or itching of skin; sexual dysfunction; chest pain or palpitations; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium:

Sodium Diuril®: 500 mg

Suspension, oral:

Diuril®: 250 mg/5 mL (237 mL) [contains alcohol 0.5% and benzoic acid]

Tablet: 250 mg, 500 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Suspension (Diuril)

250 mg/5 mL (237): $14.10

Tablets (Chlorothiazide)

250 mg (30): $12.99

500 mg (30): $7.99

Mechanism of ActionInhibits sodium and chloride reabsorption in the distal tubules causing increased excretion of sodium, chloride, and water resulting in diuresis. Loss of potassium, hydrogen ions, magnesium, phosphate, and bicarbonate also occurs.

Pharmacodynamics/Kinetics

Onset of action: Diuresis: Oral: 2 hours; I.V.: 15 minutes

Duration of diuretic action: Oral: 6-12 hours; I.V.: ~2 hours

Absorption: Oral: Poor

Half-life elimination: 1-2 hours

Time to peak, serum: Oral: ~4 hours; I.V.: 30 minutes

Excretion: Urine (10% to 15% [oral], 96% [I.V.] as unchanged drug)

Related Information

- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; thiazides decrease lithium clearance resulting in elevated serum lithium levels and potential toxicity; monitor serum lithium levels

Cardiovascular Considerations

Hypertension: Thiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. They may act synergistically to lower blood pressure when combined with an ACE inhibitor or beta-blocker. The initial concern about thiazide diuretic-induced hypokalemia, glucose intolerance, and lipid profiles does not appear to be of substantial clinical consequence in the treatment of hypertension. The benefits of this class of agents in the treatment of hypertension is established and compares well with other first-line therapeutic agents. The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The JNC 7 recommends diuretics for the treatment of hypertension with concurrent heart failure where diuresis is also required (loop diuretics may more frequently be required), high coronary disease risk (as in the ALLHAT trial), diabetes (beneficial in reducing CVD and stroke incidence), and recurrent stroke prevention (in combination with an ACE inhibitor). Thiazides are useful in slowing demineralization in osteoporosis, but need to be used cautiously in gout and in patients with significant history of hyponatremia.

Congestive Heart Failure: Diuretics are standard therapy for the management of edema in patients with heart failure. Thiazide diuretics may be preferred in hypertensive heart failure patients with mild fluid retention. Thiazides lose their effectiveness in patients with impaired renal function. Loop diuretics may be the preferred diuretic in heart failure because of their greater ability to increase sodium excretion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. If given the morning of surgery it may render the patient volume depleted and blood pressure may be labile during general anesthesia.

Medication Safety Issues

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(klor fen IR a meen & a seet a MIN oh fen)

U.S. Brand NamesCoricidin HBP速 Cold and Flu [OTC]

Pharmacologic CategoryAnalgesic, Miscellaneous; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of congestion, headache, aches and pains of colds and flu

Dosing: AdultsCold/flu/muscle aches: Oral: 2 tablets every 4 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Chlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Chlorpheniramine maleate 2 mg and acetaminophen 325 mg

Generic AvailableNo

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients; this may contribute to periodontal disease and oral discomfort.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause excitability, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric TreatmentDry mouth and sedation may be exacerbated by concurrent psychotropic use

Special Alerts

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Medication Safety Issues

Sound-alike/look-alike issues:

Rynatuss® may be confused with Rynatan®

Pronunciation(klor fen IR a meen, e FED rin, fen il EF rin, & kar bay ta PEN tane)

U.S. Brand NamesQuad Tann®; Quad Tann® Pediatric; Rynatuss®; Tetra Tannate Pediatric

Pharmacologic CategoryAlpha/Beta Agonist; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of cough with a decongestant and an antihistamine

Dosing: AdultsCough/rhinitis/nasal congestion: Oral: 1-2 tablets every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCough/rhinitis/nasal congestion: Oral:

<2 years: Titrate dose individually

2-6 years: 2.5-5 mL every 12 hours

>6 years: 5-10 mL every 12 hours

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Pregnancy Risk FactorC

Metabolism/Transport EffectsChlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension:

Quad Tann® Pediatric: Chlorpheniramine tannate 4 mg, ephedrine tannate 5 mg, phenylephrine tannate 5 mg, and carbetapentane tannate 30 mg per 5 mL (480 mL) [contains sodium benzoate; grape flavor]

Tetra Tannate Pediatric: Chlorpheniramine tannate 4 mg, ephedrine tannate 5 mg, phenylephrine tannate 5 mg, and carbetapentane tannate 30 mg per 5 mL (240 mL, 480 mL) [alcohol free; strawberry flavor]

Tablet:

Rynatuss®: Chlorpheniramine tannage 5 mg, ephedrine tannate 10 mg, phenylephrine tannate 10 mg, and carbetapentane tannate 60 mg

Tablet, long acting:

Quad Tann®: Chlorpheniramine tannage 5 mg, ephedrine tannate 10 mg, phenylephrine tannate 10 mg, and carbetapentane tannate 60 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Suspension (Rynatuss Pediatric)

(120): $107.99

Tablets (Rynatuss)

(30): $147.38

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Chlorpheniramine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Ephedrine: No significant effects or complications reported.

Phenylephrine: Up to 10% of patients could experience tachycardia, palpitations, and xerostomia; use vasoconstrictor with caution.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

Ephedrine: Use vasoconstrictor with caution since ephedrine may enhance cardiostimulation and vasopressor effects of sympathomimetics

Phenylephrine: Use with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDrowsiness is common; may cause excitability, nervousness, fatigue, or depression
Mental Health: Effects on Psychiatric TreatmentDry mouth and sedation may be exacerbated by concurrent psychotropic use

Pronunciation(klor fen IR a meen, fen il EF rin, KOE deen, & poe TASS ee um EYE oh dide)

U.S. Brand NamesPediacof® [DSC]

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Opioid; Antitussive; Expectorant; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of rhinitis, nasal congestion and cough due to colds or allergy

Dosing: PediatricCough, rhinitis, nasal congestion: Children 6 months to 12 years: 1.25-10 mL every 4-6 hours

RestrictionsC-V

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Metabolism/Transport EffectsChlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Potassium Iodide may enhance the adverse/toxic effect of Lithium. Specifically the hypothyroid/goiter-potentiating effects. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Sodium Iodide I131: Antithyroid Agents may diminish the therapeutic effect of Sodium Iodide I131. Management: Discontinue antithyroid therapy 3-4 days prior to sodium iodide I-131 administration. *Risk X: Avoid combination*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Antithyroid Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup: Chlorpheniramine maleate 0.75 mg, phenylephrine hydrochloride 2.5 mg, codeine phosphate 5 mg, and potassium iodide 75 mg per 5 mL (480 mL) [contains alcohol 5% and sodium benzoate; raspberry flavor] [DSC]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Syrup (Pediacof)

2.5-0.75-5-75 mg/5 mL (120): $19.66

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Chlorpheniramine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Phenylephrine: Up to 10% of patients could experience tachycardia, palpitations, and xerostomia (prolonged use worsens); use vasoconstrictor with caution.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDrowsiness is common; may cause excitability, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric TreatmentDry mouth and sedation may be exacerbated by concurrent psychotropic use

Index TermsCodeine, Chlorpheniramine, Phenylephrine, and Potassium Iodide; Phenylephrine, Chlorpheniramine, Codeine, and Potassium Iodide; Potassium Iodide, Chlorpheniramine, Phenylephrine, and Codeine

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

U.S. Brand NamesC-Phen DM; Ceron-DM; Corfen DM; De-Chlor DM; De-Chlor DR; Dec-Chlorphen DM [DSC]; Dex PC; Donatussin DM [DSC]; Ed A-Hist DM; Father John's® Plus [OTC]; Mintuss DR; Neo DM; Norel DM™; PD-Cof; PE-Hist DM; Phenabid DM®; Poly Tussin DM; Robitussin® Cough and Allergy [OTC]; Robitussin® Cough and Cold Nighttime [OTC]; Robitussin® Pediatric Cough and Cold Nighttime [OTC]; Rondec®-DM ; Sildec PE-DM; Statuss™ DM; Tri-Vent™ DPC [DSC]; Trital DM; Tussplex™ DM

Pharmacologic CategoryAlpha/Beta Agonist; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of cough and upper respiratory symptoms associated with allergies or the common cold

Dosing: Adults**Relief of cough and cold symptoms:** Oral:

Rondec®-DM syrup: 5 mL every 4-6 hours (maximum: 30 mL/24 hours)

Tri-Vent™ DPC: 10 mL every 6 hours (maximum: 40 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRelief of cough and cold symptoms: Oral:

6-12 months (Rondec®-DM drops): 0.75 mL 4 times/day

1-2 years (Rondec®-DM drops): 1 mL 4 times/day

2-6 years:

Rondec®-DM syrup: 1.25 mL every 4-6 hours (maximum: 7.5 mL/24 hours)

Tri-Vent™ DPC: 2.5 mL every 6 hours (maximum: 10 mL/24 hours)

6-12 years:

Rondec®-DM syrup: 2.5 mL every 4-6 hours (maximum: 15 mL/24 hours)

Tri-Vent™ DPC: 5 mL every 6 hours (maximum: 20 mL/24 hours)

Children ≥12 years: Refer to adult dosing.

Dietary ConsiderationsRobitussion® Cough and Allergy, Robitussin® Cough and Cold Nighttime, and Robitussin® Pediatric Cough and Cold Nighttime contain sodium 3 mg/5 mL. Donatussin DM contains phenylalanine 7 mg/5 mL.

ContraindicationsHypersensitivity to chlorpheniramine, phenylephrine, dextromethorphan, or any component of the formulation; use with or within 14 days of MAO inhibitor; severe hypertension or coronary artery disease; peptic ulcer disease; narrow-angle glaucoma; urinary retention

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Not for OTC use in children <2 years of age.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever, rash, or persistent headache. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Chlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Dextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid:

Corfen DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 10 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [grape flavor]

De-Chlor DM: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 10 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [strawberry flavor]

De-Chlor DR: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 6 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [strawberry flavor]

Father John's® Plus: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 5 mg, and dextromethorphan hydrobromide 5 mg per 15 mL (118 mL) [alcohol free]

Norel DM™: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 10 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; contains propylene glycol; grape flavor]

Trital DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 10 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; contains sodium benzoate; grape flavor]

Liquid, oral [drops]:

Ceron DM: Chorpheniramine maleate 1 mg, phenylephrine hydrochloride 3.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [alcohol free, sugar free; contains sodium benzoate; grape flavor] [DSC]

C-Phen DM: Chlorpheniramine maleate 1 mg, phenylephrine hydrochloride 3.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [grape flavor]

Donatussin DM: Chlorpheniramine maleate 1 mg, phenylephrine hydrochloride 1.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [alcohol free, sugar free; contains propylene glycol; bubblegum flavor] [DSC]

Neo DM: Chlorpheniramine maleate 0.75 mg, phenylephrine hydrochloride 1.75 mg, and dextromethorphan hydrobromide 2.75 mg per 1 mL (30 mL) [alcohol free, sugar free; contains propylene glycol; black cherry flavor]

PD-Cof: Chlorpheniramine maleate 1 mg, phenylephrine hydrochloride 3.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [alcohol free, sugar free; grape flavor]

Rondec® DM, Sildec PE-DM [DSC]: Chlorpheniramine maleate 1 mg, phenylephrine hydrochloride 3.5 mg, and dextromethorphan hydrobromide 3 mg per 1 mL (30 mL) [alcohol free, sugar free; grape flavor]

Suspension:

Donatussin DM: Dexchlorpheniramine tannate 2 mg, phenylephrine tannate 20 mg, and dextromethorphan tannate 30 mg per 5 mL (480 mL) [alcohol free, sugar free; contains phenylalanine 7 mg/5 mL, propylene glycol; cotton candy strawberry flavor] [DSC]

Syrup:

Ceron-DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, sugar free; contains sodium benzoate; grape flavor]

C-Phen DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (120 mL, 480 mL) [grape flavor]

Dec-Chlorphen DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (120 mL, 480 mL) [alcohol free, dye free, sugar free; grape flavor] [DSC]

Dex PC: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 6 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [strawberry flavor]

Ed A-Hist DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 10 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, sugar free; contains propylene glycol; banana flavor]

Mintuss DR: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 6 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free; strawberry flavor]

PD-Cof: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, sugar free; grape flavor]

PE-Hist DM: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [strawberry flavor]

Poly Tussin DM: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, sugar free]

Robitussion® Cough and Allergy: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 5 mg, and dextromethorphan hydrobromide 10 mg per 5 mL (120 mL) [alcohol free; contains sodium 3 mg/5 mL, sodium benzoate, and propylene glycol] [DSC]

Robitussin® Cough and Cold Nighttime: Chlorpheniramine maleate 1 mg, phenylephrine hydrochloride 2.5 mg, and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL) [alcohol free; contains sodium 3 mg/5 mL, sodium benzoate, and propylene glycol]

Robitussin® Pediatric Cough and Cold Nighttime: Chlorpheniramine maleate 1 mg, phenylephrine hydrochloride 2.5 mg, and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL) [alcohol free; contains sodium 3 mg/5 mL, sodium benzoate, and propylene glycol; fruit punch flavor]

Rondec®-DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (120 mL, 480 mL) [alcohol free, sugar free; contains propylene glycol; grape flavor]

Sildec PE-DM: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 12.5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [grape flavor]

Statuss™: DM: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 10 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, sugar free; raspberry flavor]

Tri-Vent™ DPC: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 6 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free; contains sodium benzoate, propylene glycol; strawberry flavor] [DSC]

Tussplex™ DM: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 5 mg, and dextromethorphan hydrobromide 15 mg per 5 mL (480 mL) [alcohol free, sugar free; contains sodium benzoate; strawberry flavor]

Tablet, timed release:

Phenabid DM®: Chlorpheniramine maleate 8 mg, phenylephrine hydrochloride 20 mg, and dextromethorphan hydrobromide 30 mg [scored; dye free, sugar free]

Generic AvailableYes: Excludes timed release tablet

Pricing: U.S. (www.drugstore.com)

Liquid (C-Phen DM)

3.5-1-3 mg/mL (30): $29.96

Syrup (Rondec DM)

12.5-4-15 mg/5 mL (473): $172.27

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment:

Chlorpheniramine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Dextromethorphan: No significant effects or complications reported

Phenylephrine: Up to 10% of patients could experience tachycardia, palpitations, and xerostomia (prolonged use worsens); use vasoconstrictor with caution.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

Chlorpheniramine, Dextromethorphan: No information available to require special precautions

Phenylephrine: Use with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental Status Drowsiness is common; may cause excitability, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric Treatment Dry mouth and sedation may be exacerbated by concurrent psychotropic use

Index Terms Dextromethorphan, Chlorpheniramine, and Phenylephrine; Phenylephrine, Chlorpheniramine, and Dextromethorphan

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Pronunciation(klor fen IR a meen, fen il EF rin, & fen il tole LOKS a meen)

U.S. Brand NamesChlorex-A; Comhist® [DSC]; Nalex®-A; NoHist-A; Rhinacon A

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of rhinitis and nasal congestion due to colds or allergy

Dosing: AdultsRhinitis and nasal congestion: Oral:

Nalex®-A liquid: 10 mL every 4-6 hours

Nalex®-A tablet: 1 tablet 2-3 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRhinitis and nasal congestion: Oral:

Children:

2-6 years: Nalex®-A liquid: 1.25-2.5 mL every 4-6 hours

6-12 years:

Nalex®-A liquid: 5 mL every 4-6 hours

Nalex®-A tablet: $^{1}/_{2}$ tablet 2-3 times/day

Children >12 years: Refer to adult dosing.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to chlorpheniramine, phenylephrine, phenyltoloxamine, or any component of the formulation; use with or within 14 days of MAO inhibitor; severe hypertension; narrow-angle glaucoma; acute asthma

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe hypertension.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted for this combination.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, palpitation

Central nervous system: Headache, dizziness, sedation, excitation (children), nervousness, seizure

Dermatologic: Urticaria, drug rash

Gastrointestinal: Dry mouth, anorexia, nausea, vomiting, diarrhea, constipation, GI upset

Genitourinary: Urinary frequency, urinary retention

Hematologic: Agranulocytosis, leukopenia, thrombocytopenia

Ocular: Blurred vision

Respiratory: Dry nose/throat, thickening of bronchial secretions, wheezing, stuffy nose, tightness of chest

Metabolism/Transport EffectsChlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid: Chlorpheniramine maleate 2.5 mg, phenylephrine hydrochloride 5 mg, and phenyltoloxamine citrate 7.5 mg per 5 mL (480 mL)

Nalex®-A, NoHist-A, Rhinacon A: Chlorpheniramine maleate 2.5 mg, phenylephrine hydrochloride 5 mg, and phenyltoloxamine citrate 7.5 mg per 5 mL (480 mL) [alcohol free, sugar free; cotton candy flavor]

Tablet:

Comhist®: Chlorpheniramine maleate 2 mg, phenylephrine hydrochloride 10 mg, and phenyltoloxamine citrate 25 mg [DSC]

Tablet, extended release:

Rhinacon A: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 20 mg, and phenyltoloxamine citrate 40 mg

Tablet, prolonged release:

Nalex®-A: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 20 mg, and phenyltoloxamine citrate 40 mg

Tablet, sustained release:

Chlorex-A: Chlorpheniramine maleate 4 mg, phenylephrine hydrochloride 20 mg, and phenyltoloxamine citrate 40 mg

Generic AvailableYes: Liquid
Pricing: U.S. (www.drugstore.com)

Liquid (Chlorphen-Phenyltolox-PE)

2.5-7.5-5 mg/5 mL (473): $28.00

Tablets (Comhist)

2-10-25 mg (30): $32.99

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Chlorpheniramine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Phenylephrine: Up to 10% of patients could experience tachycardia, palpitations, and xerostomia; use vasoconstrictor with caution.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response
Mental Health: Effects on Mental StatusDrowsiness is common; may cause excitability, nervousness, fatigue, or depression
Mental Health: Effects on Psychiatric TreatmentDry mouth and sedation may be exacerbated by concurrent psychotropic use
Index TermsPhenylephrine, Chlorpheniramine, and Phenyltoloxamine; Phenyltoloxamine, Chlorpheniramine, and Phenylephrine

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Rynatan® may be confused with Rynatuss®

Pronunciation(klor fen IR a meen & fen il EF rin)

U.S. Brand NamesAcitfed® Cold & Allergy [OTC] *[reformulation]*; AllanTan Pediatric [DSC]; AlleRx™ Suspension; C-Phen; Ceron; Dallergy Drops; Dallergy®-JR; Dec-Chlorphen; Ed A-Hist™; Ed ChlorPed D; NoHist; P-Tann D; PD-Hist-D; PediaTan™ D; Phenabid®; R-Tanna; R-Tanna Pediatric; Rescon-Jr®; Rinate™ Pediatric; Rondec® ; Rynatan®; Rynatan® Pediatric; Sildec PE [DSC]; Sudafed PE® Sinus & Allergy [OTC]; Tannate Pediatric; Triaminic® Cold and Allergy [OTC]

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of upper respiratory conditions such as nasal congestion, runny nose, and sneezing due to the common cold, hay fever, or allergic or vasomotor rhinitis

Dosing: Adults

Antihistamine/decongestant: Oral:

AlleRx™: 15 mL every 12 hours

Dallergy®-JR: Two capsules every 12 hours; maximum 4 capsules/24 hours

Dallergy®-JR suspension: 10 mL every 12 hours

Ed A-Hist™: One caplet every 12 hours

R-Tanna: 1-2 tablets every 12 hours

Rondec® syrup: 5 mL every 4-6 hours; maximum 30 mL/24 hours

Rynatan® tablet: 1-2 tablets every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Antihistamine/decongestant:** Oral: Children:

6-12 months: Rondec® drops: 0.75 mL 4 times/day

1-2 years: Rondec® drops: 1 mL 4 times/day

2-6 years:

AlleRx™: 1.25 -2.5 mL every 12 hours

Dallergy®-JR suspension: 2.5 mL every 12 hours

Rondec® syrup: 1.25 mL every 4-6 hours; maximum 7.5 mL/24 hours

Rynatan® suspension: 2.5 -5 mL every 12 hours

6-12 years:

AlleRx™: 2.5- 5 mL every 12 hours

Dallergy®-JR: One capsule every 12 hours; maximum 2 capsules/24 hours

Dallergy®-JR suspension: 5 mL every 12 hours

Ed A-Hist™: One-half caplet every 12 hours

Rondec® syrup: 2.5 mL every 4-6 hours; maximum 15 mL/24 hours

Rynatan® suspension: 5-10 mL every 12 hours

≥12 years: Refer to adult dosing.

Administration: OralShake suspensions well prior to use. Ed A-Hist™ caplets may be broken in half; do not crush or chew.

ContraindicationsHypersensitivity to chlorpheniramine, phenylephrine, or any component of the formulation; severe hypertension; severe cardiovascular disease; use with or within 2 weeks of discontinuing MAO inhibitor; narrow-angle glaucoma; urinary retention; peptic ulcer disease; acute asthma attack; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Not for OTC use in children <2 years of age.

Dosage form specific issues:

- Tartrazine: Some products may contain tartrazine.

Other warnings/precautions:

- Self-medication (OTC use): When used for self medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever. Discontinue and contact healthcare provider if nervousness, dizziness or sleeplessness occur.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination.
LactationExcretion in breast milk unknown/contraindicated
Breast-Feeding Considerations Use while breast-feeding is specifically contraindicated by some manufacturers.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Metabolism/Transport EffectsChlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Elixir:

Dihistine® DH: Chlorpheniramine maleate 2 mg, pseudoephedrine hydrochloride 30 mg, and codeine phosphate 10 mg per 5 mL (120 mL, 480 mL) [contains alcohol; grape flavor] [DSC]

Generic Available No

Pharmacodynamics/Kinetics See individual agents.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment:

Chlorpheniramine: Significant xerostomia with prolonged use (normal salivary flow resumes upon discontinuation).

Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Use with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental Status Drowsiness is common; may cause excitability, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric Treatment Dry mouth and sedation may be exacerbated by concurrent psychotropic use

Index Terms Codeine, Chlorpheniramine, and Pseudoephedrine; Pseudoephedrine, Chlorpheniramine, and Codeine

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state "Do not use in children under four years of age." In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

Pronunciation(klor fen IR a meen, soo doe e FED rin, & deks troe meth OR fan)

U.S. Brand NamesDicel™ DM; DuraTan™ Forte; Kidkare Children's Cough and Cold [OTC]; Pedia Relief™ [OTC]; Rescon DM [OTC]; Tanafed DMX™; Tannate PD-DM

Pharmacologic CategoryAlpha/Beta Agonist; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporarily relieves nasal congestion, runny nose, cough, and sneezing due to the common cold, hay fever, or allergic rhinitis

Dosing: AdultsGeneral dosing guidelines; consult specific product labeling. Relief of cold symptoms: Oral:

Chlorpheniramine maleate 1 mg, pseudoephedrine 15 mg, and dextromethorphan hydrobromide 7.5 mg per 5 mL: 20 mL every 6 hours

Chlorpheniramine maleate 2 mg, pseudoephedrine 30 mg, and dextromethorphan hydrobromide 10 mg per tablet or 5 mL (Rescon DM): 10 mL every 4-6 hours (maximum: 4 doses/24 hours)

Dexchlorpheniramine tannate 2.5 mg, pseudoephedrine tannate 75 mg, and dextromethorphan tannate 25 mg (Tanafed DMX™): 10-20 mL every

12 hours (maximum: 40 mL/24 hours)

Dexchlorpheniramine tannate 3.5 mg, pseudoephedrine tannate 45 mg, and dextromethorphan tannate 30 mg (DuraTan™ Forte): 5-15 mL every 12 hours (maximum: 30 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricGeneral dosing guidelines; consult specific product labeling.

Relief of cold symptoms: Children: Oral:

2-6 years:

Dexchlorpheniramine tannate 2.5 mg, pseudoephedrine tannate 75 mg, and dextromethorphan tannate 25 mg (Tanafed DMX™): 2.5-5 mL every 12 hours (maximum: 10 mL/24 hours)

Dexchlorpheniramine tannate 3.5 mg, pseudoephedrine tannate 45 mg, and dextromethorphan tannate 30 mg (DuraTan™ Forte): 1.25-2.5 mL every 12 hours (maximum: 5 mL/24 hours)

6-12 years:

Chlorpheniramine maleate 1 mg, pseudoephedrine 15 mg, and dextromethorphan hydrobromide 7.5 mg per 5 mL: 10 mL every 6 hours

Chlorpheniramine maleate 1 mg, pseudoephedrine 15 mg, and dextromethorphan hydrobromide 5 mg per tablet or 5 mL: 2 tablets or 10 mL every 4-6 hours (maximum: 4 doses/24 hours)

Chlorpheniramine maleate 2 mg, pseudoephedrine 30 mg, and dextromethorphan hydrobromide 10 mg per tablet or 5 mL (Rescon DM): 5 mL every 4-6 hours (maximum: 4 doses/24 hours)

Dexchlorpheniramine tannate 2.5 mg, pseudoephedrine tannate 75 mg, and dextromethorphan tannate 25 mg (Tanafed DMX™): 5-10 mL every 12 hours (maximum: 20 mL/24 hours)

Dexchlorpheniramine tannate 3.5 mg, pseudoephedrine tannate 45 mg, and dextromethorphan tannate 30 mg (DuraTan™ Forte): 2.5-5 mL every 12 hours (maximum: 10 mL/24 hours)

>12 years: Refer to adult dosing.

StorageStore at controlled room temperature.

ContraindicationsHypersensitivity to chlorpheniramine, pseudoephedrine, dextromethorphan, or any component of the formulation; use with or within 2 weeks of discontinuing MAO inhibitor

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Not labeled for OTC use in children <6 years of age.

Other warnings/precautions:

- Cough: Appropriate use: Underlying cause of cough should be determined prior to prescribing.
- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever, rash, or persistent headache. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination product.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk, however, the AAP considers it to be “compatible” with breast-feeding. Information for chlorpheniramine and dextromethorphan is not available.

Adverse ReactionsSee individual agents.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid: Chlorpheniramine maleate 1 mg, pseudoephedrine hydrochloride 15 mg, and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL)

Kidkare Children's Cough and Cold: Chlorpheniramine maleate 1 mg, pseudoephedrine hydrochloride 15 mg, and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL) [alcohol free; contains propylene glycol and sodium benzoate; cherry flavor]

Pedia Relief™: Chlorpheniramine maleate 1 mg, pseudoephedrine hydrochloride 15 mg, and dextromethorphan hydrobromide 5 mg per 5 mL (120 mL) [alcohol free; contains propylene glycol and sodium benzoate; cherry flavor]

Rescon DM: Chlorpheniramine maleate 2 mg, pseudoephedrine hydrochloride 30 mg, and dextromethorphan hydrobromide 10 mg per 5 mL (120 mL, 480 mL) [dye free; contains propylene glycol; cherry flavor]

Suspension:

Dicel™ DM: Chlorpheniramine tannate 5 mg, pseudoephedrine tannate 75 mg, and dextromethorphan tannate 25 mg per 5 mL (480 mL) [contains sodium benzoate; cotton candy flavor]

DuraTan™ Forte: Dexchlorpheniramine tannate 3.5 mg, pseudoephedrine tannate 45 mg, and dextromethorphan tannate 30 mg per 5 mL (480 mL) [contains sodium benzoate; grape flavor]

Tanafed DMX™: Dexchlorpheniramine tannate 2.5 mg, pseudoephedrine tannate 75 mg, and dextromethorphan tannate 25 mg (120 mL, 480 mL) [contains sodium benzoate; cotton candy flavor]

Tannate PD-DM: Dexchlorpheniramine tannate 3 mg, pseudoephedrine tannate 50 mg, and dextromethorphan tannate 27.5 mg per 5 mL (473 mL) [contains sodium benzoate; grape flavor]

Generic AvailableYes: Liquid
Pricing: U.S. (www.drugstore.com)

Suspension (Tanafed DMX)

75-2.5-25 mg/5 mL (118): $60.83

Mechanism of Action

Chlorpheniramine competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract. Dexchlorpheniramine is the predominant active isomer of chlorpheniramine and is approximately twice as active as the racemic compound.

Pseudoephedrine is a sympathomimetic amine and isomer of ephedrine; acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals.

Dextromethorphan is a chemical relative of morphine lacking narcotic properties except in overdose; controls cough by depressing the medullary cough center.

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Chlorpheniramine
- Dextromethorphan
- Pseudoephedrine

Pharmacotherapy Pearls

Chlorpheniramine **maleate** is ~70% chlorpheniramine; chlorpheniramine **tannate** is ~44% chlorpheniramine.

Dexchlorpheniramine **maleate** is ~70% dexchlorpheniramine; dexchlorpheniramine **tannate** is ~45% dexchlorpheniramine.

Dextromethorphan **hydrobromide** is ~77% dextromethorphan; dextromethorphan **tannate** is ~42% dextromethorphan.

Pseudoephedrine **hydrochloride** is ~82% pseudoephedrine; pseudoephedrine **tannate** is ~29% pseudoephedrine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Chlorpheniramine: Significant xerostomia with prolonged use (normal salivary flow resumes upon discontinuation).

Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response
Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, insomnia, restlessness, hallucinations, or depression
Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment; may cause tremor which may be mistaken for EPS; may cause tachycardia; tachycardia is also common with clozapine; monitor vital signs; may cause sedation (concurrent use with psychotropics may produce additive sedative effects)
Index TermsChlorpheniramine Maleate, Pseudoephedrine Hydrochloride, and Dextromethorphan Hydrobromide; Chlorpheniramine Tannate, Pseudoephedrine Tannate, and Dextromethorphan Tannate; Dexchlorpheniramine Tannate, Pseudoephedrine Tannate, and Dextromethorphan Tannate; Dextromethorphan, Chlorpheniramine, and Pseudoephedrine; Pseudoephedrine, Chlorpheniramine, and Dextromethorphan

U.S. Brand NamesAmdry-C; Coldamine; Durahist™; Hista-Vent® PSE [DSC]

Pharmacologic CategoryAlpha/Beta Agonist; Anticholinergic Agent; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsRelief of symptoms of allergic rhinitis, vasomotor rhinitis, sinusitis, and the common cold

Dosing: AdultsRhinitis, sinusitis, common cold: Oral: Durahist™, Hista-Vent® PSE: One tablet every 12 hours (maximum dose: 2 tablets/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRhinitis, sinusitis, common cold: Oral:

Children 6-11 years: Durahist™, Hista-Vent® PSE: One-half tablet every 12 hours (maximum dose: 1 tablet/24 hours)

Children ≥12 years: Refer to adult dosing.

Administration: OralDurahist™, Hista-Vent® PSE: Swallow whole, do not crush or chew; may split in half

StorageStore at controlled room temperature between 15ºC to 30ºC (59ºF to 86ºF).

ContraindicationsHypersensitivity to chlorpheniramine, pseudoephedrine, methscopolamine, or any component of the formulation; severe hypertension; severe coronary artery disease; use with or within 2 weeks of discontinuing MAO inhibitor; narrow-angle glaucoma; urinary retention; peptic ulcer disease; during an asthmatic attack; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression and blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Neuropathy: Use with caution in patients with autonomic neuropathy.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.
- Ulcerative colitis: Use with caution in patients with ulcerative colitis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Safety and efficacy have not been established in children <6 years of age.

Geriatric Considerations

Because of its anticholinergic effects, this product is not considered a treatment of choice in the elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination; see individual agents

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk. Excretion of chlorpheniramine or methscopolamine in breast milk is unknown. Breast-feeding with this combination is contraindicated by some manufacturers. See individual agents.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, cardiovascular collapse, flushing, hypotension, pallor, palpitation, tachycardia

Central nervous system: Anxiety, convulsions, CNS depression, dizziness, drowsiness, excitability, fear, giddiness, hallucinations, headache, insomnia, irritability, lassitude, nervousness, restlessness, tremor

Gastrointestinal: Gastric irritation, nausea, xerostomia

Genitourinary: Dysuria, urinary retention

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision

Respiratory: Dry nose, dry throat, respiratory difficulty

Metabolism/Transport EffectsChlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4(major); **Inhibits** CYP2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess for potential interactions with other pharmacological agents patient may be taking (eg, concurrent CNS depressants or anticholinergic psychotropics may cause additive effects). Assess effectiveness of therapy (relief of symptoms) and adverse reactions at beginning of therapy and periodically with long-term use. Teach patient/caregiver appropriate use, possible side effects and interventions to reduce side effects, and adverse symptoms to report.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not increase dose or take more often than prescribed. Do not chew or crush tablets (may split Durahist™ or Hista-Vent® PSE in half). Avoid excessive alcohol. May cause drowsiness, dizziness, excitability, sleep disturbance, nervousness, restlessness, or blurred vision (do not drive or engage in activities that require alertness and coordination until response to drug is known); dry mouth or gastric irritation (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); urinary retention (void before taking medication). Report chest pain, palpitations or rapid heart beat; excessive or persistent CNS changes (depression, excitability, irritability, insomnia); respiratory difficulties; or lack of improvement or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, extended release:

Coldamine: Chlorpheniramine maleate 8 mg, pseudoephedrine hydrochloride 90 mg, and methscopolamine nitrate 2.5 mg

Tablet, sustained release: Chlorpheniramine maleate 8 mg, pseudoephedrine hydrochloride 60 mg, and methscopolamine nitrate 1.25 mg; chlorpheniramine maleate 8 mg, pseudoephedrine hydrochloride 90 mg, and methscopolamine nitrate 2.5 mg

Amdry-C: Chlorpheniramine maleate 8 mg, pseudoephedrine hydrochloride 120 mg, and methscopolamine nitrate 2.5 mg [scored]

Durahist™: Chlorpheniramine maleate 8 mg, pseudoephedrine hydrochloride 60 mg, and methscopolamine nitrate 1.25 mg [scored]

Hista-Vent® PSE: Chlorpheniramine maleate 8 mg, pseudoephedrine hydrochloride 120 mg, and methscopolamine nitrate 2.5 mg [dye free; scored] [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Hista-Vent PSE)

8-120-2.5 mg (100): $39.64

Tablet, controlled release (AlleRx Dose Pack)

120-2.5 & 8-2.5 mg (20): $27.33

Mechanism of Action

Chlorpheniramine maleate: Blocks histamine H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pseudoephedrine: Acts as a decongestant in respiratory tract mucous membranes

Methscopolamine nitrate: Derivative of scopolamine, antisecretory effects

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Chlorpheniramine: Significant xerostomia with prolonged use (normal salivary flow resumes upon discontinuation).

Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Methscopolamine: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and dry throat and nose. Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause sedation, anxiety, dizziness, giddiness, hallucinations, insomnia, irritability, nervousness, restlessness, or tremor

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 2 weeks of discontinuing an MAO inhibitor. Sedating agent; concurrent use with CNS depressant or alcohol may produce additive effects. Contains an anticholinergic agent; concurrent use with anticholinergic psychotropics may produce additive effects.

Index TermsMethscopolamine, Chlorpheniramine, and Pseudoephedrine; Methscopolamine, Pseudoephedrine, and Chlorpheniramine; Pseudoephedrine Hydrochloride, Methscopolamine Nitrate, and Chlorpheniramine Maleate; Pseudoephedrine, Methscopolamine, and Chlorpheniramine

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Medication Safety Issues

Sound-alike/look-alike issues:

Allerest® may be confused with Sinarest®

Chlor-Trimeton® may be confused with Chloromycetin®

Sudafed® may be confused with Sufenta®

Pronunciation(klor fen IR a meen & soo doe e FED rin)

U.S. Brand NamesAllerest® Maximum Strength Allergy and Hay Fever [OTC]; Deconamine® SR; Dicel™; Duratuss® DA; Dynahist-ER Pediatric® [DSC]; Histade™ [DSC]; Histex™; LoHist-D; QDALL® [DSC]; Suclor™; Sudafed® Sinus & Allergy [OTC]; SudaHist®; Sudal® 12

Canadian Brand NamesTriaminic® Cold & Allergy

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsRelief of nasal congestion associated with the common cold, hay fever, and other allergies, sinusitis, eustachian tube blockage, and vasomotor and allergic rhinitis

Dosing: AdultsGeneral dosing guidelines; consult specific product labeling.

Rhinitis/nasal decongestant: Oral:

Chlorpheniramine maleate 4 mg and pseudoephedrine hydrochloride 60 mg every 4-6 hours (immediate release products)

Deconamine® SR: Chlorpheniramine maleate 8 mg and pseudoephedrine hydrochloride 120 mg every 12 hours

Chlorpheniramine tannate 4.5 mg and pseudoephedrine tannate 75 mg: 10-20 mL every 12 hours (maximum: 40 mL/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricGeneral dosing guidelines; consult specific product labeling.

Rhinitis/decongestant: Oral: Children:

2-6 years:

Chlorpheniramine maleate 1 mg and pseudoephedrine hydrochloride 15 mg every 4-6 hours

Chlorpheniramine tannate 4.5 mg and pseudoephedrine tannate 75 mg: 2.5-5 mL every 12 hours (maximum: 10 mL/24 hours)

6-12 years: Chlorpheniramine maleate 2 mg and pseudoephedrine hydrochloride 30 mg every 4-6 hours (immediate release products)

Children ≥12 years: Refer to adult dosing.

Administration: OralSwallow sustained release formulations whole, do not crush or chew.

Dietary ConsiderationsTriaminic® Cold and Allergy chewable tablet contains coconut oil, phenylalanine 17.6 mg/tablet, and sodium 5 mg/tablet.

ContraindicationsHypersensitivity to chlorpheniramine, pseudoephedrine, or any component of the formulation; severe hypertension; severe cardiovascular disease; use with or within 2 weeks of discontinuing MAO inhibitor; narrow-angle glaucoma; urinary retention; peptic ulcer disease; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.

- Diabetes: Use with caution in patients with diabetes mellitus.

- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.

- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.

- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).

- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Antihistamines may cause excitation in young children. Not labeled for OTC use in children <6 years of age.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.

Other warnings/precautions:

- Self-medication (OTC use): When used for self medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever. Discontinue and contact healthcare provider if nervousness, dizziness or sleeplessness occur.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination product. See individual agents.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsPseudoephedrine is excreted in breast milk. Some manufacturers contraindicate its use; however, the AAP considers it to be “compatible” with breast-feeding. Information for chlorpheniramine is not available. Also see individual agents.

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Chlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, extended release: Chlorpheniramine maleate 8 mg and pseudoephedrine hydrochloride 120 mg; chlorpheniramine maleate 12 mg and pseudoephedrine hydrochloride 100 mg

Duratuss® DA: Chlorpheniramine maleate 12 mg and pseudoephedrine hydrochloride 100 mg

Dynahist-ER Pediatric®: Chlorpheniramine maleate 4 mg and pseudoephedrine hydrochloride 60 mg [DSC]

Histade™: Chlorpheniramine maleate 12 mg and pseudoephedrine hydrochloride 120 mg [DSC]

QDALL®: Chlorpheniramine maleate 12 mg and pseudoephedrine hydrochloride 100 mg [DSC]

Suclor™: Chlorpheniramine maleate 8 mg and pseudoephedrine hydrochloride 120 mg

Capsule, sustained release: Chlorpheniramine maleate 8 mg and pseudoephedrine hydrochloride 120 mg

Deconamine® SR: Chlorpheniramine maleate 8 mg and pseudoephedrine hydrochloride 120 mg

Liquid:

Histex™: Chlorpheniramine maleate 2 mg and pseudoephedrine sulfate 30 mg per 5 mL (480 mL) [peach flavor]

LoHist-D: Chlorpheniramine maleate 2 mg and pseudoephedrine hydrochloride 30 mg per 5 mL (480 mL) [alcohol free, dye free; peach flavor]

Suspension:

Dicel™: Chlorpheniramine tannate 5 mg and pseudoephedrine tannate 75 mg per 5 mL (480 mL) [contains sodium benzoate; strawberry banana flavor]

Syrup: Chlorpheniramine maleate 2 mg and pseudoephedrine hydrochloride 30 mg per 5 mL (480 mL)

Tablet: Chlorpheniramine maleate 4 mg and pseudoephedrine hydrochloride 60 mg

Allerest® Maximum Strength Allergy and Hay Fever: Chlorpheniramine maleate 2 mg and pseudoephedrine hydrochloride 30 mg

Sudafed® Sinus & Allergy: Chlorpheniramine maleate 4 mg and pseudoephedrine hydrochloride 60 mg

Tablet, chewable:

Sudal® 12: Chlorpheniramine maleate 4 mg and pseudoephedrine hydrochloride 30 mg [contains phenylalanine 25 mg/tablet; grape flavor]

Tablet, sustained release:

SudaHist: Chlorpheniramine maleate 12 mg and pseudoephedrine hydrochloride 120 mg

Generic AvailableYes: Excludes suspension and chewable tablet

Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Histade CR)

12-120 mg (60): $21.99

Syrup (Deconamine)

2-30 mg/5 mL (120): $43.99

Tablets (Deconamine)

4-60 mg (60): $104.99

Mechanism of Action

Chlorpheniramine competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract.

Pseudoephedrine is a sympathomimetic amine and isomer of ephedrine; acts as a decongestant in respiratory tract mucous membranes with less vasoconstrictor action than ephedrine in normotensive individuals.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Chlorpheniramine
- Pseudoephedrine

Pharmacotherapy Pearls

Chlorpheniramine **maleate** is ~70% chlorpheniramine; chlorpheniramine **tannate** is ~44% chlorpheniramine.

Pseudoephedrine **hydrochloride** is ~82% pseudoephedrine; pseudoephedrine **tannate** is ~29% pseudoephedrine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Chlorpheniramine: Prolonged use will cause significant xerostomia (normal salivary flow resumes upon discontinuation).

Pseudoephedrine: Xerostomia (prolonged use worsens; normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusDrowsiness is common; may cause excitability, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric TreatmentDry mouth and sedation may be exacerbated by concurrent psychotropic use

Index TermsChlorpheniramine Maleate and Pseudoephedrine Hydrochloride; Chlorpheniramine Tannate and Pseudoephedrine Tannate; Pseudoephedrine and Chlorpheniramine

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsSymptomatic relief of rhinitis and nasal congestion due to colds or allergy

Dosing: Adults**Rhinitis, nasal congestion due to colds or allergy:** Oral:

Tablet (Ru-Hist Forte, Poly Hist Forte®): 1 tablet 2-3 times/day

Liquid (MyHist-PD, Poly Hist PD, Triplex™ AD): 5-10 mL every 4-6 hours, not to exceed 40 mL/day

Suspension (AllerTan™, Conal): 5-10 mL every 12 hours, not to exceed 20 mL/day

Dosing: Pediatric**Rhinitis, nasal congestion due to colds or allergy:** Oral:

Tablet (Ru-Hist Forte, Poly Hist Forte®):

Children <6 years: Dosage not established.

Children 6-12 years: $^{1}/_{2}$ tablet 2-3 times/day

Children >12 years: Refer to adult dosing.

Liquid (MyHist-PD, Poly Hist PD):

Children 2-6 years: 2.5 mL every 4-6 hours, not to exceed 10 mL/day

Children 6-12 years: 5 mL every 4-6 hours, not to exceed 20 mL/day

Children >12 years: Refer to adult dosing.

Liquid (Triplex™ AD):

Children <6 years: Dosage not established

Children 6-12 years: 5 mL every 4-6 hours, not to exceed 20 mL/day

Children >12: Refer to adult dosing.

Suspension (AllerTan™, Conal):

Children 2-6 years: 2.5 mL every 12 hours, not to exceed 5 mL/day

Children 6-12 years: 5 mL every 12 hours, not to exceed 10 mL/day

Children >12 years: Refer to adult dosing.

Administration: OralDo not break or crush tablets. Shake liquid suspension well before use.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect liquid from freezing.

ContraindicationsHypersensitivity to phenylephrine, chlorpheniramine, pyrilamine, any sympathomimetic amines, or any component; severe hypertension; severe coronary artery disease; diabetes mellitus; hyperthyroidism; use with or within 14 days of MAO inhibitor; premature or newborn infants; acute asthma

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe hypertension.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or urinary obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Geriatric ConsiderationsDue to the anticholinergic effects of chlorpheniramine and the sympathomimetic effects of phenylephrine, this product is not recommended for the elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproductive studies have not been conducted with this combination.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Hyper-/hypotension, palpitation

Central nervous system: Dizziness, excitation (children), headache, nervousness, sedation, seizure

Dermatologic: Drug rash, urticaria

Gastrointestinal: Anorexia, constipation, diarrhea, dry mouth, GI upset, nausea, vomiting

Genitourinary: Urinary frequency, urinary retention

Hematologic: Agranulocytosis, leukopenia, thrombocytopenia

Ocular: Blurred vision

Respiratory: Dry nose/throat, stuffy nose, thickening of bronchial secretions, tightness of chest, wheezing

Metabolism/Transport EffectsChlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, oral:

MyHist-PD: Chlorpheniramine maleate 2 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 7.5 mg per 5 mL (473 mL) [dye free, ethanol free, sugar free; bubblegum flavor]

Poly Hist PD: Chlorpheniramine maleate 2 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 7.5 mg per 5 mL (480 mL) [dye free, ethanol free, sugar free; contains propylene glycol; bubblegum flavor]

Triplex™ AD: Chlorpheniramine maleate 2 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 7.5 mg per 5 mL (473 mL) [dye free, ethanol free, sugar free; contains sodium benzoate; bubblegum flavor]

Suspension, oral:

AllerTan™: Chlorpheniramine maleate 8 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 15 mg per 5 mL (473 mL) [contains sodium benzoate; grape flavor]

Chlor-Tan A 12: Chlorpheniramine maleate 2 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 5 mg per 5 mL (118 mL) [ethanol free, sugar free; raspberry flavor] [DSC]

Chlorex-A 12: Chlorpheniramine maleate 2 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 5 mg per 5 mL (120 mL) [raspberry flavor] [DSC]

Conal: Chlorpheniramine maleate 8 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 15 mg per 5 mL (473 mL) [contains phenylalanine 7 mg/5 mL, propylene glycol; raspberry flavor]

Nalex A 12: Chlorpheniramine tannate 2 mg, pyrilamine tannate 12.5 mg, and phenylephrine tannate 5 mg per 5 mL (120 mL) [contains benzoic acid; raspberry flavor]

Tri-Hist: Chlorpheniramine maleate 2 mg, pyrilamine maleate 12.5 mg, and phenylephrine hydrochloride 5 mg per 5 mL (120 mL)

Tablet, sustained release, oral:

Poly Hist Forte®: Chlorpheniramine maleate 4 mg, pyrilamine maleate 25 mg, and phenylephrine hydrochloride 10 mg

Tablet, time-released, oral: Chlorpheniramine maleate 4 mg, pyrilamine maleate 25 mg, and phenylephrine hydrochloride 10 mg

Ru-Hist Forte: Chlorpheniramine maleate 4 mg, pyrilamine maleate 25 mg, and phenylephrine hydrochloride 10 mg

Generic AvailableYes

Pharmacodynamics/KineticsSee individual agents.

Mental Health: Effects on Mental StatusMay cause dizziness, nervousness, sedation, or excitation (children).

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. May cause CNS depression; concomitant use with psychotropic agents may produce additive effects. May cause agranulocytosis; use with caution in patients receiving clozapine and carbamazepine. May cause anticholinergic side effects; concurrent use with psychotropic agents may produce additive effects. Use may mitigate effects of acetylcholinesterase inhibitors. Tricyclic antidepressants may enhance the vasopressor effect of phenylephrine.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Medication Safety Issues

Sound-alike/look-alike issues:

Chlor-Trimeton® may be confused with Chloromycetin®

Pronunciation(klor fen IR a meen)

U.S. Brand NamesAhist™; Aller-Chlor® [OTC]; Chlor-Trimeton® [OTC]; Chlorphen [OTC]; CPM-12; Diabetic Tussin® Allergy Relief [OTC]; PediaTan™; QDALL® AR; Teldrin® HBP [OTC]

Canadian Brand NamesChlor-Tripolon®; Novo-Pheniram

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsPerennial and seasonal allergic rhinitis and other allergic symptoms including urticaria

Use: DentalTreatment of histamine-induced allergic symptoms

Dosing: AdultsAllergic symptoms, allergic rhinitis: Oral: 4 mg every 4-6 hours, not to exceed 24 mg/day or sustained release 8-12 mg every 8-12 hours, not to exceed 24 mg/day

Dosing: ElderlyAllergic symptoms, rhinitis: Oral: 4 mg once or twice daily, or 8 mg sustained release at bedtime. **Note:** Duration of action may be 36 hours or more when serum concentrations are low.

Dosing: Pediatric

Allergic symptoms, allergic rhinitis: Children: Oral: 0.35 mg/kg/day in divided doses every 4-6 hours

2-6 years: 1 mg every 4-6 hours, not to exceed 6 mg in 24 hours

6-12 years: 2 mg every 4-6 hours, not to exceed 12 mg/day or sustained release 8 mg at bedtime

Children >12 years: Refer to adult dosing.

Dosing: Renal ImpairmentHemodialysis: Supplemental dose is not necessary.

Administration: OralTimed release oral forms are to be swallowed whole, not crushed or chewed.

Dietary ConsiderationsMay be taken with food or water.

StorageProtect from light.

ContraindicationsHypersensitivity to chlorpheniramine maleate or any component of the formulation; narrow-angle glaucoma; bladder neck obstruction; symptomatic prostate hypertrophy; during acute asthmatic attacks; stenosing peptic ulcer; pyloroduodenal obstruction. Avoid use in premature and term newborns due to possible association with SIDS.

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Respiratory disease: Use with caution in patients with asthma or other chronic breathing disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children. Not for OTC use in children <2 years of age.

Geriatric ConsiderationsAnticholinergic action may cause significant confusional symptoms, constipation, or problems voiding urine. If an antihistamine is indicated, a second generation nonsedating antihistamine would be a more appropriate choice.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with chlorpheniramine tannate.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Slight to moderate drowsiness

Respiratory: Thickening of bronchial secretions

1% to 10%:

Central nervous system: Headache, excitability, fatigue, nervousness, dizziness

Gastrointestinal: Nausea, xerostomia, diarrhea, abdominal pain, appetite increase, weight gain

Genitourinary: Urinary retention

Neuromuscular & skeletal: Arthralgia, weakness

Ocular: Diplopia

Renal: Polyuria

Respiratory: Pharyngitis

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central).

Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

CPM-12: Chlorpheniramine maleate 12 mg

Capsule, variable release, as maleate:

QDALL® AR: Chlorpheniramine 12 mg [immediate release and sustained release]

Suspension, as tannate:

PediaTan™: 8 mg/5 mL (480 mL) [sugar free; contains sodium benzoate; bubble gum flavor]

Syrup, as maleate:

Aller-Chlor®: 2 mg/5 mL (120 mL) [contains alcohol 5%]

Diabetic Tussin® Allergy Relief: 2 mg/5 mL (120 mL) [alcohol free, dye free, sugar free]

Tablet, as maleate: 4 mg

Aller-Chlor®, Chlor-Trimeton®, Chlorphen, Teldrin® HBP: 4 mg

Tablet, extended release, as maleate:

Chlor-Trimeton®: 12 mg

Tablet, long acting, as tannate [scored]:

Ahist™: 12 mg

Generic AvailableYes: Syrup, tablet

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract

Pharmacodynamics/KineticsHalf-life elimination, serum: 20-24 hours

Pharmacotherapy PearlsNot effective for nasal stuffiness.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Chronic use of antihistamines will inhibit salivary flow, particularly in elderly patients; this may contribute to periodontal disease and oral discomfort.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause excitability, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric TreatmentDry mouth and sedation may be exacerbated by concurrent psychotropic use

Index TermsChlorpheniramine Maleate; CTM

International Brand NamesAhiston (IL); Alerfin (PY); Alergical (PE); Alergidryl (AR); Alergitrat (AR); Aller (MY); Allerfin (BF, BJ, CI, ET, GH, GM, GN, KE, LR, MA, ML, MR, MU, MW, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Allergex (ZA); Allergyl (BF, BJ, CI, ET, GH, GM, GN, KE, LR, MA, ML, MR, MU, MW, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Allermin (TW); Analerg (UY); Antadex-H (MX); Antamin (PH); Antihistamin (PE); Barominic (PH); Bregamin (MX); Cadistin (BF, BJ, CI, ET, GH, GM, GN, IN, KE, LR, MA, ML, MR, MU, MW, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Chloramine (SG); Chlorleate (TH); Chlorpheniramine DHA (HK); Chlorpheno (TH); Chlorphenon (ID); Chlorpyrimine (HK, MY, TH); Chlortrimeton (ZA); Clodryl (CO); Cloro Trimeton (AR); Cloro-Trimeton (MX); Cloroalergan (PE); Clorotrimeton (CO, PE, VE); Cohistan (ID, TH); Com-Trimeton (TW); CTM (ID); Derimeton (MX); Histal (BB, BM, BS, BZ, GY, JM, NL, PR, SR, TT); Histat (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Histatapp (TH); Histavil (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Histin (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Istamex (GR); Niramine (TW); Orphen (ID); Pirafene (BG); Piriton (AE, BB, BH, BM, BS, BZ, CY, EG, GB, GY, IE, IL, IQ, IR, JM, JO, KW, LB, LY, MY, NL, OM, PK, PR, QA, SA, SR, SY, TT, YE); Trimeton (IT); Tromine (HK); Valemine (PH)

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

ChlorproMAZINE may be confused with chlordiazePOXIDE, chlorproPAMIDE, clomiPRAMINE, prochlorperazine, promethazine

Thorazine® may be confused with thiamine, thioridazine

Pronunciation(klor PROE ma zeen)

Canadian Brand NamesLargactil®; Novo-Chlorpromazine

Pharmacologic CategoryAntimanic Agent; Antipsychotic Agent, Typical, Phenothiazine

Use: Labeled IndicationsControl of mania; treatment of schizophrenia; control of nausea and vomiting; relief of restlessness and apprehension before surgery; acute intermittent porphyria; adjunct in the treatment of tetanus; intractable hiccups; combativeness and/or explosive hyperexcitable behavior in children 1-12 years of age and in short-term treatment of hyperactive children

Use: Unlabeled/InvestigationalManagement of psychotic disorders; behavioral symptoms associated with dementia (elderly); psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Schizophrenia/psychoses:

Oral: Range: 30-800 mg/day in 1-4 divided doses, initiate at lower doses and titrate as needed; usual dose: 200-600 mg/day; some patients may require 1-2 g/day

I.M., I.V.: Initial: 25 mg, may repeat (25-50 mg) in 1-4 hours, gradually increase to a maximum of 400 mg/dose every 4-6 hours until patient is controlled; usual dose: 300-800 mg/day

Intractable hiccups: Oral, I.M.: 25-50 mg 3-4 times/day

Nausea and vomiting:

Oral: 10-25 mg every 4-6 hours

I.M., I.V.: 25-50 mg every 4-6 hours

Dosing: Elderly

Behavioral symptoms associated with dementia (unlabeled use): Initial: 10-25 mg 1-2 times/day; increase at 4- to 7-day intervals by 10-25 mg/day. Increase dose intervals (eg, twice daily, 3 times/day) as necessary to control behavior response or side effects; maximum daily dose: 800 mg; gradual increases (titration) may prevent some side effects or decrease their severity.

Other indications: Refer to adult dosing.

Dosing: Pediatric

Schizophrenia/psychoses: Children ≥6 months:

Oral: 0.5-1 mg/kg/dose every 4-6 hours; older children may require 200 mg/day or higher.

I.M., I.V.: 0.5-1 mg/kg/dose every 6-8 hours; maximum dose for <5 years (22.7 kg): 40 mg/day; maximum for 5-12 years (22.7-45.5 kg): 75 mg/day

Nausea and vomiting: Children ≥6 months:

Oral: 0.5-1 mg/kg/dose every 4-6 hours as needed

I.M., I.V.: 0.5-1 mg/kg/dose every 6-8 hours; maximum dose for <5 years (22.7 kg): 40 mg/day; maximum for 5-12 years (22.7-45.5 kg): 75 mg/day

Dosing: Renal ImpairmentNot dialyzable (0% to 5%)

Dosing: Hepatic ImpairmentAvoid use in severe hepatic dysfunction.

Administration: I.V.Direct of intermittent infusion: Infuse 1 mg or portion thereof over 1 minute. **Note:** Avoid skin contact with solution; may cause contact dermatitis.

StorageInjection: Protect from light. A slightly yellowed solution does not indicate potency loss, but a markedly discolored solution should be discarded. Diluted injection (1 mg/mL) with NS and stored in 5 mL vials remains stable for 30 days.

ReconstitutionDilute injection (1 mg/mL) with NS for I.V. administration.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Amsacrine, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, docetaxel, doxorubicin, doxorubicin liposome, famotidine, filgrastim, fluconazole, gatifloxacin, gemcitabine, granisetron, heparin, hydrocortisone sodium succinate, ondansetron, potassium chloride, propofol, teniposide, thiotepa, vinorelbine, vitamin B complex with C. **Incompatible:** Allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, cefepime, etoposide phosphate, fludarabine, furosemide, linezolid, melphalan, methotrexate, paclitaxel, piperacillin/tazobactam, sargramostim. **Variable (consult detailed reference):** Remifentanil, TPN.

Compatibility in syringe: Compatible: Atropine, benztropine, butorphanol, diphenhydramine, doxapram, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, pentazocine, perphenazine, prochlorperazine edisylate, promazine, promethazine, scopolamine. **Incompatible:** Cimetidine, dimenhydrinate, heparin, pentobarbital, thiopental. **Variable (consult detailed reference):** Ranitidine.

Compatibility when admixed: Compatible: Ascorbic acid injection, ethacrynate, netilmicin, theophylline, vitamin B complex with C. **Incompatible:** Aminophylline, amphotericin B, ampicillin, chloramphenicol, chlorothiazide, floxacillin, furosemide, methohexital, penicillin G potassium, penicillin G sodium, phenobarbital. **Variable (consult detailed reference):** Pentobarbital.

ContraindicationsHypersensitivity to chlorpromazine or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression; coma

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).
- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, chlorpromazine has a moderate potency of cholinergic blockade.
- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).
- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is low-moderate relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hypotension: Significant hypotension may occur, particularly with parenteral administration.

- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: Highly sedating which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression; blood dyscrasias have occurred. Use only if benefits outweigh risk.

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Chlorpromazine is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.

Dosage form specific issues:

- Sulfites: Injection contains sulfites.

Geriatric ConsiderationsMany elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

Any changes in disease status in any organ system can result in behavior changes.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding ConsiderationsDrowsiness and lethargy have been reported in nursing infants; galactorrhea has been reported in mother.

Adverse ReactionsFrequency not defined.

Cardiovascular: Postural hypotension, tachycardia, dizziness, nonspecific QT changes

Central nervous system: Drowsiness, dystonias, akathisia, pseudoparkinsonism, tardive dyskinesia, neuroleptic malignant syndrome, seizure

Dermatologic: Photosensitivity, dermatitis, skin pigmentation (slate gray)

Endocrine & metabolic: Lactation, breast engorgement, false-positive pregnancy test, amenorrhea, gynecomastia, hyper- or hypoglycemia

Gastrointestinal: Xerostomia, constipation, nausea

Genitourinary: Urinary retention, ejaculatory disorder, impotence

Hematologic: Agranulocytosis, eosinophilia, leukopenia, hemolytic anemia, aplastic anemia, thrombocytopenic purpura

Hepatic: Jaundice

Ocular: Blurred vision, corneal and lenticular changes, epithelial keratopathy, pigmentary retinopathy

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (strong), 2E1 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: ChlorproMAZINE may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Haloperidol: May enhance the QTc-prolonging effect of ChlorproMAZINE. ChlorproMAZINE may decrease the metabolism of Haloperidol. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Valproic Acid: ChlorproMAZINE may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid St John's wort (may decrease chlorpromazine levels, increase photosensitization, or enhance sedative effect). Avoid dong quai (may enhance photosensitization). Avoid kava kava, gotu kola, valerian (may increase CNS depression).

Test InteractionsFalse-positives for phenylketonuria, amylase, uroporphyrins, urobilinogen. May cause false-positive pregnancy test.

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status; abnormal involuntary movement scale (AIMS); extrapyramidal symptoms (EPS)

Reference Range

Therapeutic: 50-300 ng/mL (SI: 157-942 nmol/L)

Toxic: >750 ng/mL (SI: >2355 nmol/L); serum concentrations poorly correlate with expected response

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Review ophthalmic exam and monitor laboratory results, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. **I.V./I.M.:** Significant hypotension may occur. Initiate at lower doses (see Dosing) and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. **Note:** Chlorpromazine may cause false-positive pregnancy test.

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. Do not discontinue this medication without consulting prescriber. Tablets may be taken with food. Do not take within 2 hours of any antacid. Store away from light. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May turn urine red-brown (normal). You may experience excess drowsiness, lightheadedness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); dry mouth, upset stomach, nausea, vomiting, anorexia (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); ejaculatory dysfunction (reversible); decreased perspiration (avoid strenuous exercise in hot environments); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, or severe dizziness; unresolved urinary retention or changes in urinary pattern; altered menstrual pattern, change in libido, swelling or pain in breasts (male or female); vision changes, skin rash, irritation, or changes in color of skin (gray-blue); or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 25 mg/mL (1 mL, 2 mL)

Tablet, as hydrochloride: 10 mg, 25 mg, 50 mg, 100 mg, 200 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (ChlorproMAZINE HCl)

10 mg (60): $16.99

25 mg (60): $17.99

50 mg (60): $17.99

100 mg (60): $15.99

200 mg (60): $26.99

Mechanism of ActionChlorpromazine is an aliphatic phenothiazine antipsychotic which blocks postsynaptic mesolimbic dopaminergic receptors in the brain; exhibits a strong alpha-adrenergic blocking effect and depresses the release of hypothalamic and hypophyseal hormones; believed to depress the reticular activating system, thus affecting basal metabolism, body temperature, wakefulness, vasomotor tone, and emesis

Pharmacodynamics/Kinetics

Onset of action: I.M.: 15 minutes; Oral: 30-60 minutes

Absorption: Rapid

Distribution: V_d: 20 L/kg; crosses the placenta; enters breast milk

Protein binding: 92% to 97%

Metabolism: Extensively hepatic to active and inactive metabolites

Bioavailability: 20%

Half-life, biphasic: Initial: 2 hours; Terminal: 30 hours

Excretion: Urine (<1% as unchanged drug) within 24 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Xerostomia (normal salivary flow resumes upon discontinuation).

Significant hypotension may occur, especially when the drug is administered parenterally. Orthostatic hypotension is due to alpha-receptor blockade; elderly are at greater risk.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Increased confusion, memory loss, psychotic behavior, and agitation frequently occur as a consequence of anticholinergic effects. Antipsychotic-associated sedation in nonpsychotic patients is extremely unpleasant due to feelings of depersonalization, derealization, and dysphoria.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure. Chlorpromazine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health CommentChlorpromazine is a low-potency typical antipsychotic. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. Compared to newer "atypical" antipsychotics, typical antipsychotics may have a greater propensity to cause extrapyramidal symptoms (EPS).

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Index TermsChlorpromazine Hydrochloride; CPZ

Medication Safety Issues

Sound-alike/look-alike issues:

> ChlorproPAMIDE may be confused with chlorproMAZINE
>
> Diabinese® may be confused with DiaBeta®, Dialume®, Diamox®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(klor PROE pa mide)
U.S. Brand NamesDiabinese® [DSC]
Canadian Brand NamesApo-Chlorpropamide®; Novo-Propamide
Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea
Use: Labeled IndicationsManagement of blood sugar in type 2 diabetes mellitus (noninsulin dependent, NIDDM)
Use: Unlabeled/InvestigationalNeurogenic diabetes insipidus
Dosing: AdultsType 2 diabetes: Oral: The dosage of chlorpropamide is variable and should be individualized based upon the patient's response

Initial dose: 250 mg/day in mild-to-moderate diabetes in middle-aged, stable diabetic; 100-125 mg/day in older patients

Titration: Subsequent dosages may be increased or decreased by 50-125 mg/day at 3- to 5-day intervals

Maintenance dose: 100-250 mg/day; severe patients with diabetes may require 500 mg/day; avoid doses >750 mg/day

Dosing: ElderlyReduce initial dose to 100-125 mg/day in older patients; subsequent dosages may be increased or decreased by 50-125 mg/day at 3- to 5-day intervals (slower upward titration may be appropriate in older patients)
Dosing: Renal Impairment

Cl_{cr} <50 mL/minute: Avoid use.

Hemodialysis: Removed with hemoperfusion.

Peritoneal dialysis: Supplemental dose is not necessary.

Dosing: Hepatic ImpairmentDosage reduction is recommended. Conservative initial and maintenance doses are recommended in patients with liver impairment because chlorpropamide undergoes extensive hepatic metabolism.
Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsDietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness). May cause GI upset; take with food. Take at the same time each day; eat regularly and do not skip meals.
ContraindicationsHypersensitivity to chlorpropamide, sulfonylureas, sulfonamides, or any component of the formulation; type 1 diabetes mellitus (insulin dependent, IDDM); diabetic ketoacidosis
Allergy Considerations

- Sulfonylurea Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.
- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides,

and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea or sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related issues:

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Long half-life: Patients should be properly instructed in the early detection and treatment of hypoglycemia; long half-life may complicate recovery from excess effects.

Geriatric Considerations Because of chlorpropamide's long half-life, duration of action, drug interactions, and the increased risk for hypoglycemia, it is not considered a hypoglycemic agent of choice in the elderly. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk Factor C

Pregnancy Considerations Animal reproduction studies have not been conducted; therefore, the manufacturer classifies chlorpropamide as pregnancy category C. Chlorpropamide crosses the placenta and measurable serum concentrations can be found in infants exposed *in utero*. Teratogenic effects have been associated with chlorpropamide use in some studies; however, it is unknown if this is related to the medication or uncontrolled diabetes. Nonteratogenic adverse effects (eg, severe neonatal hypoglycemia, increased perianatal mortality) have also been associated with maternal chlorpropamide use. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. The manufacturer recommends if chlorpropamide is used during pregnancy, it should be discontinued at least 1 month before the expected delivery date. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

Lactation Enters breast milk/not recommended

Breast-Feeding Considerations Chlorpropamide is found in breast milk. Breast-feeding is not recommended by the manufacturer. Potentially, hypoglycemia may occur in a nursing infant exposed to a sulfonylurea via breast milk.

Pregnancy & Lactation, In-Depth

- ChlorproPAMIDE in Pregnancy & Lactation

Adverse Reactions Frequency not defined.

Central nervous system: Dizziness, headache

Dermatologic: Erythema multiforme, exfoliative dermatitis, maculopapular eruptions, photosensitivity, pruritus, urticaria

Endocrine & metabolic: Disulfiram-like reactions, hypoglycemia, SIADH

Gastrointestinal: Anorexia, diarrhea, hunger, nausea, proctocolitis, vomiting

Hematologic: Agranulocytosis, aplastic anemia, eosinophilia, hemolytic anemia, leukopenia, pancytopenia, porphyria cutanea tarda, thrombocytopenia

Hepatic: Cholestatic jaundice, hepatic porphyria

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor)

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Allopurinol: May increase the serum concentration of ChlorproPAMIDE. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hyperglycemic effect of Sulfonylureas. Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (possible disulfiram-like reaction).

Herb/Nutraceutical: Herbs with hypoglycemic properties may enhance the hypoglycemic effect of chlorpropamide. This includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle

Monitoring ParametersBlood glucose, Hgb A_{1c}; monitor for signs and symptoms of hypoglycemia (fatigue, sweating, numbness of extremities)

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Monitoring: Lab TestsBlood glucose, Hgb A_{1c}

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 100 mg, 250 mg

Diabinese®: 100 mg, 250 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (ChlorproPAMIDE)

100 mg (60): $17.24

250 mg (60): $20.99

Tablets (Diabinese)

250 mg (60): $77.27

Mechanism of ActionStimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Peak effect: 3-6 hours

Duration of action: 24 hours

Absorption: Rapid

Distribution: V_d: 0.13-0.23 L/kg

Protein binding: 90%

Metabolism: Extensively hepatic (~80%), primarily via CYP2C9; forms metabolites

Half-life elimination: ~36 hours; prolonged in elderly or with renal impairment

End-stage renal disease: 50-200 hours

Time to peak, serum: 2-4 hours

Excretion: Urine

Related Information

- Diabetes Mellitus Management, Adults
- Sulfonamide Derivatives

Dental Health: Effects on Dental Treatment Chlorpropamide-dependent patients with diabetes (noninsulin dependent, Type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Dizziness is common

Mental Health: Effects on Psychiatric Treatment Rare reports of agranulocytosis; use caution with clozapine and carbamazepine

Cardiovascular Considerations The possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents. An early study suggested poor cardiovascular outcomes in patients with diabetes treated with tolbutamide. Retrospective studies evaluating cardiovascular outcomes following angioplasty and acute myocardial infarction in patients with diabetes receiving newer sulfonylureas are inconsistent. Longer-term prospective trials of sulfonylurea therapy, such as the UKPDS, do not reveal any increased cardiovascular mortality.

Anesthesia and Critical Care Concerns/Other Considerations Long half-life may complicate recovery from excess effects. Patients previously maintained on insulin at <40 units/day may be directly changed to chlorpropamide. Patients previously receiving larger insulin doses should have their insulin doses decreased by 50% daily for the first few days, then gradually reduced further as necessary.

The possibility of higher doses of sulfonylureas eliciting an increase in cardiovascular events, because of their effects on blocking potassium sensitive ATP channels, has been raised. However, there are presently only limited data to support this premise, particularly with newer generation agents.

International Brand Names Abemide (JP, TW); Adiaben (HR); Anti-D (SG); Arodoc C (JP); Bioglumin (ES); Chlormide (JP); Chlorpropamid (PL); Chlorpropamide Medochemie (MY); Copamide (IN); Dabinese (VE); Diabeedol (TH); Diabemide (BF, BJ, CI, ET, GH, GM, GN, IT, KE, LR, MA, ML, MR, MU, MW, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Diabenese (AE, AR, BB, BF, BH, BJ, BM, BS, BZ, CI, CO, CR, CY, DO, EG, ET, GB, GH, GM, GN, GR, GT, GY, HN, IL, IQ, IR, IT, JM, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, MX, NE, NG, NI, NL, NO, OM, PA, PR, PT, QA, SA, SC, SD, SL, SN, SR, SV, SY, TN, TT, TZ, UG, YE, ZA, ZM, ZW); Diabet (ES); Diabexan (IT); Diabines (SE); Diabinese (AU, BE, BR, CH, CN, ES, HK, HR, ID, IE, KP, LU, PE, PH, PK, PL, TH, UY); Diabitex (BB, BM, BS, BZ, GY, JM, NL, SR, TT, ZA); Dibecon (TH); Glicoben (BR); Glycemin (TH); Hypomide (ZA); Insogen (MX); Meldian (HR); Mellitos C (JP); Propamide (MY, TH); Trane (AR)

Chlorthalidone

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(klor THAL i done)
U.S. Brand NamesThalitone®
Canadian Brand NamesApo-Chlorthalidone®
Pharmacologic Category[Diuretic, Thiazide]
Use: Labeled IndicationsManagement of mild-to-moderate hypertension when used alone or in combination with other agents; treatment of edema associated with congestive heart failure or nephrotic syndrome. Recent studies have found chlorthalidone effective in the treatment of isolated systolic hypertension in the elderly.
Use: Unlabeled/InvestigationalPediatric hypertension
Dosing: Adults

Hypertension: Oral: 25-100 mg/day or 100 mg 3 times/week; usual dosage range (JNC 7): 12.5-25 mg/day

Edema: Initial: 50-100 mg/day or 100 mg on alternate days; maximum dose: 200 mg/day

Heart failure-associated edema: 12.5-25 mg once daily; maximum daily dose: 100 mg (ACC/AHA 2005 Heart Failure Guidelines)

Dosing: ElderlyOral: Initial: 12.5-25 mg/day or every other day; there is little advantage to using doses >25 mg/day.
Dosing: PediatricOral: Children (nonapproved): 2 mg/kg/dose 3 times/week or 1-2 mg/kg/day

Hypertension (unlabeled use): Initial: 0.3 mg/kg once daily, up to 2 mg/kg/day; maximum: 50 mg/day

Dosing: Renal ImpairmentCl_{cr} <10 mL/minute: Avoid use. Ineffective with low GFR (Aronoff G, 2002)

Note: ACC/AHA 2005 Heart Failure Guidelines suggest that thiazides lose their efficacy when Cl_{cr} <40 mL/minute

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Dietary ConsiderationsThis product may cause a potassium loss; your healthcare provider may prescribe a potassium supplement, another medication to help prevent the potassium loss, or recommend that you eat foods high in potassium, especially citrus fruits; do not change your diet on your own while taking this medication, especially if you are taking potassium supplements or medications to reduce potassium loss; too much potassium can be as harmful as too little.
ContraindicationsHypersensitivity to chlorthalidone or any component of the formulation; cross-sensitivity with other thiazides or sulfonamides; anuria; renal decompensation; pregnancy
Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte disturbances: Hypokalemia, hypochloremic alkalosis, and hyponatremia can occur.
- Photosensitivity: Photosensitization may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with thiazide or sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations.
- Hypokalemia: Use with caution in patients with hypokalemia; correct before initiating therapy.
- Renal impairment: Avoid in severe renal disease (ineffective).

- Systemic lupus erythematosus (SLE): Can cause SLE exacerbation or activation.

Geriatric ConsiderationsStudies have found chlorthalidone effective in the treatment of isolated systolic hypertension in the elderly. The use of chlorthalidone as a step 1 medication reduced the incidence of stroke in the SHEP trial.
Pregnancy Risk FactorB (manufacturer); D (expert analysis)
LactationEnters breast milk/use caution (AAP rates “compatible”)
Adverse Reactions

1% to 10%:

Dermatologic: Photosensitivity

Endocrine & metabolic: Hypokalemia

Gastrointestinal: Anorexia, epigastric distress

<1% (Limited to important or life-threatening): Agranulocytosis, aplastic anemia, cholecystitis, constipation, cutaneous vasculitis, diarrhea, dizziness, glycosuria, headache, hepatic function impairment, hypercalcemia, hyperglycemia, hyperuricemia or gout, hyponatremia, insomnia, leukopenia, muscle cramps or spasm, nausea, necrotizing angiitis, pancreatitis, paresthesia, polyuria, purpura, rash, restlessness, sexual ability (decreased), thrombocytopenia, urticaria, vomiting, vasculitis, weakness

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid dong quai, St John's Wort (may also cause photosensitization). Avoid ephedra, yohimbe, ginseng (may worsen hypertension).
Test InteractionsIncreased creatine phosphokinase [CPK] (S), ammonia (B), amylase (S), calcium (S), chloride (S), cholesterol (S), glucose, increased acid (S), decreased chloride (S), magnesium, potassium (S), sodium (S)
Monitoring ParametersAssess weight, I & O records daily to determine fluid loss; blood pressure, serum electrolytes, renal function
Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Monitor electrolyte balance and renal function on a regular basis throughout therapy. Assess therapeutic effectiveness and adverse response (eg, blood pressure, fluid status) regularly during long-term therapy. Caution patients with diabetes to monitor glucose levels (may reduce effect of oral hypoglycemics). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsSerum electrolytes, renal function
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take once-daily dose in morning or last of daily doses early in the day to avoid night-time disturbances. You may need to make dietary changes (eg, your prescriber may recommend a potassium supplement or foods high in potassium; do not increase your potassium intake unless recommended to do so). If using oral hypoglycemics, monitor glucose levels closely (this medication may reduce effect of oral hypoglycemics); contact prescriber with any major changes. May cause sensitivity to sunlight (use sunblock, wear protective clothing, and avoid direct sunlight); or anorexia or GI distress (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report muscle twitching or cramps; nausea or vomiting; confusion; numbness of extremities; loss of appetite or GI distress; severe rash, redness, or itching of skin; chest pain or palpitations;

respiratory difficulty; unusual weight loss; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg, 100 mg

Thalitone®: 15 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Chlorthalidone)

25 mg (90): $29.99

50 mg (30): $19.99

100 mg (30): $33.99

Tablets (Thalitone)

15 mg (30): $41.41

Mechanism of ActionSulfonamide-derived diuretic that inhibits sodium and chloride reabsorption in the cortical-diluting segment of the ascending loop of Henle

Pharmacodynamics/Kinetics

Onset of action: Peak effect: 2-6 hours

Duration: 24-72 hours

Absorption: 65%

Distribution: Crosses placenta; enters breast milk

Metabolism: Hepatic

Half-life elimination: 35-55 hours; may be prolonged with renal impairment; Anuria: 81 hours

Excretion: Urine (~50% to 65% as unchanged drug)

Related Information

- Heart Failure (Systolic)
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentRare reports of blood dyscrasias; use caution with clozapine and carbamazepine; thiazides decrease lithium clearance resulting in elevated serum lithium levels and potential toxicity; monitor serum lithium levels

Cardiovascular Considerations

Hypertension: Thiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. They may act synergistically to lower blood pressure when combined with an ACE inhibitor or beta-blocker. The initial concern about thiazide diuretic-induced hypokalemia, glucose intolerance, and lipid profiles does not appear to be of substantial clinical consequence in the treatment of hypertension. The benefits of this class of agents in the treatment of hypertension is established and compares well with other first-line therapeutic agents. The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The JNC 7 recommends diuretics for the treatment of hypertension with concurrent heart failure where diuresis is also required (loop diuretics may more frequently be required), high coronary disease risk (as in the ALLHAT trial), diabetes (beneficial in reducing CVD and stroke incidence), and recurrent stroke prevention (in combination with an ACE inhibitor). Thiazides are useful in slowing demineralization in osteoporosis, but need to be used cautiously in gout and in patients with significant history of hyponatremia.

Congestive Heart Failure: Diuretics are standard therapy for the management of edema in patients with heart failure. Thiazide diuretics may be preferred in hypertensive heart failure patients with mild fluid retention. Thiazides lose their effectiveness in patients with impaired renal function. Loop diuretics may be the preferred diuretic in heart failure because of their greater ability to increase sodium excretion.

Chlorzoxazone

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Parafon Forte® may be confused with Fam-Pren Forte

Pronunciation(klor ZOKS a zone)
U.S. Brand NamesParafon Forte® DSC
Canadian Brand NamesParafon Forte®; Strifon Forte®
Pharmacologic CategorySkeletal Muscle Relaxant
Use: Labeled IndicationsSymptomatic treatment of muscle spasm and pain associated with acute musculoskeletal conditions
Use: DentalTreatment of muscle spasm and pain associated with acute temporomandibular joint pain (TMJ)
Dosing: AdultsMuscle spasm: Oral: 250-500 mg 3-4 times/day up to 750 mg 3-4 times/day
Dosing: ElderlyOral: Initial: 250 mg 2-4 times/day; increase as necessary to 750 mg 3-4 times/day.
Dosing: PediatricMuscle spasm: Oral: 20 mg/kg/day or 600 mg/m^2/day in 3-4 divided doses
Calculations

- Body Surface Area: Pediatrics

ContraindicationsHypersensitivity to chlorzoxazone or any component of the formulation; impaired liver function
Allergy Considerations

- Chlorzoxazone Allergy

Geriatric ConsiderationsNo data available on the use of skeletal muscle relaxants in the elderly. Start dosing low and increase as necessary. The FDA recently approved a stronger warning about hepatotoxicity in the labeling of chlorzoxazone. Because it can cause unpredictable, fatal hepatic toxicity, the use of chlorzoxazone should be avoided.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, drowsiness lightheadedness, paradoxical stimulation, malaise

Dermatologic: Rash, petechiae, ecchymoses (rare), angioneurotic edema

Gastrointestinal: Nausea, vomiting, stomach cramps

Genitourinary: Urine discoloration

Hepatic: Liver dysfunction

Miscellaneous: Anaphylaxis (very rare)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2A6 (minor), 2D6 (minor), 2E1 (major), 3A4 (minor); **Inhibits** CYP2E1 (weak), 3A4 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Chlorzoxazone. *Risk C: Monitor therapy*

Isoniazid: May decrease the metabolism of Chlorzoxazone. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Monitoring ParametersPeriodic liver functions tests
Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness (according to rationale for therapy), and adverse reactions at beginning of therapy and periodically with long-term use. Do not discontinue abruptly; taper dosage slowly. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsPeriodic liver functions
Patient EducationTake exactly as directed with food. Do not increase dose or discontinue this medication without consulting prescriber. Do not use alcohol, prescriptive or OTC antidepressants, sedatives, or pain medications without consulting prescriber. May turn urine orange or red (normal). You may experience drowsiness, dizziness, lightheadedness (avoid driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, or cramping (small frequent meals, frequent mouth care, or sucking hard candy may help); postural hypotension (change position slowly when rising from sitting or lying or when climbing stairs); or constipation (increased exercise, fluids, fruit, or fiber may help). Report excessive drowsiness or mental agitation; palpitations, rapid heartbeat, or chest pain; skin rash or

swelling of mouth or face; persistent diarrhea or constipation; or unusual weakness or bleeding. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet (Parafon Forte® DSC): 500 mg

Tablet: 250 mg, 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Chlorzoxazone)

250 mg (100): $16.99

500 mg (90): $15.00

Tablets (Parafon Forte DSC)

500 mg (30): $73.01

Mechanism of ActionActs on the spinal cord and subcortical levels by depressing polysynaptic reflexes

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Duration: 6-12 hours

Absorption: Readily absorbed

Metabolism: Extensively hepatic via glucuronidation

Excretion: Urine (as conjugates)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may produce depression or paradoxical stimulation

Mental Health: Effects on Psychiatric TreatmentMay produce aplastic anemia and leukopenia; use caution with clozapine and carbamazepine

International Brand NamesEscoflex (CH); Klorzoxazon (DK); Matalmin (TW); Muscol (TW); Myoflex (HR); Myoflexin (HN, HU); Paraflex (HR, NO, SE, ZA); Parafon DSC (IN); Parafon Forte (MX, TH); Prolax (TW); Reumophan (MX); Reumophan Alka (MX); Reumophan Vit (MX); Salalin (TW); Solaxin (HK, ID, JP); Tafirol Flex (MX)

Cholecalciferol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kole e kal SI fer ole)

U.S. Brand NamesD-3 [OTC]; D3-50™ [OTC]; D3-5™ [OTC]; Delta-D® [OTC]; Maximum D3®; Vitamin D3 [OTC]

Canadian Brand NamesD-Vi-Sol®

Pharmacologic CategoryVitamin D Analog

Use: Labeled IndicationsDietary supplement, treatment of vitamin D deficiency, or prophylaxis of deficiency

Dosing: AdultsDietary supplement: Oral: 400-1000 units/day

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypercalcemia; hypersensitivity to cholecalciferol or any component of the formulation; malabsorption syndrome; evidence of vitamin D toxicity

Geriatric ConsiderationsVitamin D, folate, and B_{12} (cyanocobalamin) have decreased absorption with age (clinical significance unknown); studies in ill geriatrics demonstrated that low serum concentrations of vitamin D result in greater bone loss. Calorie requirements decrease with age and therefore, nutrient density must be increased to ensure adequate nutrient intake, including vitamins and minerals. The use of a daily supplement with a multiple vitamin with minerals is recommended because elderly consume less vitamin D, absorption may be decreased, and many have decreased sun exposure. This is a recommendation of particular need to those with high risk for osteoporosis.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, hyper-/hypotension, cardiac arrhythmia

Central nervous system: Irritability, headache, somnolence, overt psychosis (rare)

Dermatologic: Pruritus

Endocrine & metabolic: Polydipsia

Gastrointestinal: Nausea, vomiting, anorexia, pancreatitis, metallic taste, dry mouth, constipation, weight loss

Genitourinary: Albuminuria, polyuria

Hepatic: Increased liver function test

Neuromuscular & skeletal: Bone pain, myalgia, weakness, muscle pain

Ocular: Conjunctivitis, photophobia

Renal: Azotemia, nephrocalcinosis

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak), 2C19 (weak), 2D6 (weak)

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb Interactions

Food: Olestra may impair the absorption of vitamin D.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, oral:

D-3: 1000 int. units

D3-5™: 5000 int. units

D3-50™: 50,000 int. units

Maximum D3®: 10,000 int. units [contains soybean lecithin]

Capsule, softgel, oral:

D-3: 2000 int. units

Tablet:

Delta-D®: 400 int. units

Generic AvailableYes

Pharmacodynamics/Kinetics

Distribution: Primarily hepatic

Protein binding: Extensively to vitamin D-binding protein

Metabolism: Primary liver and kidney hydroxylation; glucuronidation (minimal)

Half-life elimination: 14 hours

Time to peak, plasma: 11 hours

Excretion: As metabolites, urine (2.4%) and feces (4.9%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause irritability; rare reports of psychosis

Mental Health: Effects on Psychiatric TreatmentNone reported

Cholestyramine Resin

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(koe LES teer a meen REZ in)

U.S. Brand NamesPrevalite®; Questran®; Questran® Light

Canadian Brand NamesNovo-Cholamine; Novo-Cholamine Light; PMS-Cholestyramine; Questran®; Questran® Light Sugar Free

Pharmacologic CategoryAntilipemic Agent, Bile Acid Sequestrant

Use: Labeled IndicationsAdjunct in the management of primary hypercholesterolemia; pruritus associated with elevated levels of bile acids; diarrhea associated with excess fecal bile acids; binding toxicologic agents; pseudomembraneous colitis

Dosing: AdultsDyslipidemia: Oral (dosages are expressed in terms of anhydrous resin): 4 g 1-2 times/day to a maximum of 16-24 g/day (and a maximum of 6 times/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDyslipidemia: Oral (dosages are expressed in terms of anhydrous resin): Children: 240 mg/kg/day in 3 divided doses; need to titrate dose depending on indication

Dosing: Renal ImpairmentNot removed by hemo- or peritoneal dialysis. Supplemental doses not necessary with dialysis or continuous arteriovenous or venovenous hemofiltration effects.

Administration: OralMix powder with water or other fluid prior to administration; not to be taken in dry form. Suspension should not be sipped or held in mouth for prolonged periods (may cause tooth discoloration or enamel decay).

Dietary ConsiderationsSupplementation of vitamins A, D, E, and K, folic acid, and iron may be required with high-dose, long-term therapy.

Questran® Light contains phenylalanine 14 g/5 g powder.

Prevalite® contains phenylalanine 14.1 g/5.5 g powder.

StorageStore powder at controlled room temperature of 15°C to 30°C (59°F to 86°F). Suspension may be used for up to 48 hours after refrigeration.

ReconstitutionMix contents of 1 packet or 1 level scoop of powder with 4-6 oz of beverage. Allow to stand 1-2 minutes prior to mixing. May also be mixed with highly-fluid soups, cereals, applesauce, etc.

ContraindicationsHypersensitivity to bile acid sequestering resins or any component of the formulation; complete biliary obstruction; bowel obstruction

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Chronic use may be associated with bleeding problems (especially in high doses).
- Constipation: May produce or exacerbate constipation problems; fecal impaction may occur. Hemorrhoids may be worsened.

Concurrent drug therapy issues:

- Decreased absorption (orally administered drugs): Not to be taken simultaneously with many other medicines (decreased absorption).
- Fat-soluble vitamins/folic acid: May interfere with fat-soluble vitamins (A, D, E, K) and folic acid.

Dosage form specific issues:

- Phenylalanine: Questran® Light contains phenylalanine.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

Geriatric ConsiderationsThe definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorC

Pregnancy ConsiderationsCholestyramine is not absorbed systemically, but may interfere with vitamin absorption; therefore, regular prenatal supplementation may not be adequate. There are no studies in pregnant women; use with caution.

LactationDoes not enter breast milk/use caution

Adverse Reactions

>10%: Gastrointestinal: Constipation, heartburn, nausea, vomiting, stomach pain

1% to 10%:

Central nervous system: Headache

Gastrointestinal: Belching, bloating, diarrhea

<1% (Limited to important or life-threatening): Hyperchloremic acidosis, gallstones or pancreatitis, GI bleeding, peptic ulcer, steatorrhea or malabsorption syndrome, hypoprothrombinemia (secondary to vitamin K deficiency)

Drug Interactions

Acetaminophen: Cholestyramine Resin may decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Amiodarone: Bile Acid Sequestrants may decrease the bioavailability of Amiodarone. *Risk D: Consider therapy modification*

Antidiabetic Agents (Thiazolidinedione): Bile Acid Sequestrants may decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Calcitriol: Bile Acid Sequestrants may decrease the serum concentration of Calcitriol. *Risk C: Monitor therapy*

Cardiac Glycosides: Bile Acid Sequestrants may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Corticosteroids (Oral): Bile Acid Sequestrants may decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Ezetimibe: Bile Acid Sequestrants may decrease the absorption of Ezetimibe. *Risk C: Monitor therapy*

Fibric Acid Derivatives: Bile Acid Sequestrants may decrease the absorption of Fibric Acid Derivatives. *Risk D: Consider therapy modification*

Loop Diuretics: Bile Acid Sequestrants may decrease the absorption of Loop Diuretics. *Risk D: Consider therapy modification*

Methotrexate: Bile Acid Sequestrants may decrease the absorption of Methotrexate. *Risk C: Monitor therapy*

Methylfolate: Cholestyramine Resin may decrease the serum concentration of Methylfolate. *Risk C: Monitor therapy*

Mycophenolate: Cholestyramine Resin may decrease the serum concentration of Mycophenolate. *Risk X: Avoid combination*

Niacin: Bile Acid Sequestrants may decrease the absorption of Niacin. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: Bile Acid Sequestrants may decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Raloxifene: Bile Acid Sequestrants may decrease the absorption of Raloxifene. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Bile Acid Sequestrants may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Thiazide Diuretics: Bile Acid Sequestrants may decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Thyroid Products: Bile Acid Sequestrants may decrease the absorption of Thyroid Products. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Bile Acid Sequestrants may decrease the absorption of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Cholestyramine (especially high doses or long-term therapy) may decrease the absorption of folic acid, calcium, and iron.

Herb/Nutraceutical: Cholestyramine (especially high doses or long-term therapy) may decrease the absorption of fat-soluble vitamins (vitamins A, D, E, and K).

Test InteractionsIncreased prothrombin time; decreased cholesterol (S), iron (B)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor laboratory results, therapeutic effectiveness, and adverse reactions periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsSerum cholesterol and triglyceride levels before initiating treatment and periodically throughout treatment.

Patient EducationTake once or twice a day as directed. Do not take the powder in its dry form; mix with fluid, applesauce, pudding, or jello. Take other medications 1 hour before or 4-6 hours after cholestyramine. Ongoing medical follow-up and laboratory tests may be required. You may experience GI effects (these should resolve after continued use); nausea and vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or constipation (increased exercise, fluids, fruit, or fiber may help; consult prescriber about use of stool softener or laxative). Report unusual stomach cramping, pain or blood in stool; unresolved nausea, vomiting, or constipation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for oral suspension: Cholestyramine resin 4 g/5 g packet (60s); cholestyramine resin 4 g/5 g of powder (210 g); cholestyramine resin 4 g/5.7 g packet (60s); cholestyramine resin 4 g/5.7 g of powder (240 g can); cholestyramine resin 4 g/9 g packet (60s); cholestyramine resin 4 g of resin/9 g of powder (378 g)

Prevalite®: Cholestyramine resin 4 g/5.5 g packet (42s, 60s) [contains phenylalanine 14.1 mg/5.5 g; orange flavor]; cholestyramine resin 4 g/5.5 g of powder (231 g) [contains phenylalanine 14.1 mg/5.5 g; orange flavor]

Questran®: Cholestyramine resin 4 g/9 g packet (60s); cholestyramine resin 4 g/9 g of powder (378 g)

Questran® Light: Cholestyramine resin 4 g/5 g packet (60s) [contains phenylalanine 14 mg/5 g]; cholestyramine resin 4 g/5 g of powder (210 g) [contains phenylalanine 14 mg/5 g]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Pack (Cholestyramine)

4 g (60): $122.99

Pack (Cholestyramine Light)

4 g/dose (210): $106.24

4 g/dose (268): $89.99

Mechanism of ActionForms a nonabsorbable complex with bile acids in the intestine, releasing chloride ions in the process; inhibits enterohepatic reuptake of intestinal bile salts and thereby increases the fecal loss of bile salt-bound low density lipoprotein cholesterol

Pharmacodynamics/Kinetics

Onset of action: Peak effect: 21 days

Absorption: None

Excretion: Feces (as insoluble complex with bile acids)

Related Information

- Hyperlipidemia Management
- Lipid-Lowering Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay decrease the absorption of psychotropics including TCAs, beta-blockers, valproic acid, barbiturates

Cardiovascular ConsiderationsCholestyramine alone or when combined with an HMG-CoA reductase inhibitor is effective in lowering cholesterol. Cholestyramine may increase triglycerides, therefore, it should be avoided in patients with triglyceride levels ≥200 mg/dL. Potential factors that may limit patient compliance include GI side effects and the need to separate administration of other medications from cholestyramine.

Anesthesia and Critical Care Concerns/Other ConsiderationsCholestyramine alone or when combined with a statin is effective in lowering cholesterol. Cholestyramine may increase triglycerides, therefore, it should be avoided in patients with triglyceride levels ≥200 mg/dL. Potential factors that may limit patient compliance include GI side effects and the need to space other medications at least 1 hour before or 4 hours after cholestyramine administration.

Choline Magnesium Trisalicylate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(KOE leen mag NEE zhum trye sa LIS i late)

Pharmacologic CategorySalicylate

Use: Labeled IndicationsManagement of osteoarthritis, rheumatoid arthritis, and other arthritis; acute painful shoulder

Dosing: AdultsArthritis, pain: Oral (based on total salicylate content): 500 mg to 1.5 g 2-3 times/day **or** 3 g at bedtime; usual maintenance dose: 1-4.5 g/day

Dosing: ElderlyUsual dose: 750 mg 3 times/day.

Dosing: PediatricChildren: Oral (based on total salicylate content): <37 kg: 50 mg/kg/day given in 2 divided doses; 2250 mg/day for heavier children

Dosing: Renal ImpairmentAvoid use in severe renal impairment.

Administration: OralLiquid may be mixed with fruit juice just before drinking. Do not administer with antacids. Take with a full glass of water and remain in an upright position for 15-30 minutes after administration.

Dietary ConsiderationsTake with food or large volume of water or milk to minimize GI upset. Liquid may be mixed with fruit juice just before drinking. Hypermagnesemia resulting from magnesium salicylate; avoid or use with caution in renal insufficiency.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to salicylates, other nonacetylated salicylates, other NSAIDs, or any component of the formulation; bleeding disorders; pregnancy (3rd trimester)

Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Tinnitus: Tinnitus or impaired hearing may indicate toxicity.

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Dehydration: Use with caution in patients with dehydration.
- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Thrombosis (prophylaxis): Salicylate salts may not inhibit platelet aggregation and, therefore, should not be substituted for aspirin in the prophylaxis of thrombosis.

Special populations:

- Elderly: Use lowest effective dose for shortest period possible in the elderly; they are a high-risk population for adverse effects from NSAIDs. As many as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. CNS adverse effects may be observed in the elderly at lower doses than younger adults. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage.
- Pediatrics: Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use this product. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from nonsteroidal anti-inflammatory agents. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Avoid use of multiple drugs (OTCs) which contain salicylates (eg, bismuth subsalicylate with other salicylates). Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. There is the consideration that the use of choline magnesium salicylate may cause less gastrointestinal and renal adverse effects than ASA or other NSAIDs in the elderly. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Due to the known effects of other salicylates (closure of ductus arteriosus), use during late pregnancy should be avoided.

Lactation Enters breast milk/use caution

Breast-Feeding Considerations Excreted in breast milk; peak levels occur 9-12 hours after dose. Use caution if used during breast-feeding.

Adverse Reactions

<20%:

Gastrointestinal: Nausea, vomiting, diarrhea, heartburn, dyspepsia, epigastric pain, constipation

Otic: Tinnitus

<2%:

Central nervous system: Headache, lightheadedness, dizziness, drowsiness, lethargy

Otic: Hearing impairment

<1%: Gastric ulceration, occult bleeding, increased BUN and creatinine, rash, pruritus, anorexia, weight gain, edema, epistaxis, dysgeusia

Postmarketing and/or case reports: Asthma, bruising, confusion, duodenal ulceration, erythema multiforme, esophagitis, hallucinations, hepatic enzymes increased, hearing loss (irreversible)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: May decrease the rate but not the extent of oral absorption.

Herb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have additional antiplatelet activity). Limit curry powder, paprika, licorice, Benedictine liqueur, prunes, raisins, tea, and gherkins; may cause salicylate accumulation. These foods contain 6 mg salicylate/100 g.

Test Interactions False-negative results for glucose oxidase urinary glucose tests (Clinistix®); false-positives using the cupric sulfate method (Clinitest®); also, interferes with Gerhardt test (urinary ketone analysis), VMA determination; 5-HIAA, xylose tolerance test, and T_3 and

T_4; increased PBI

Monitoring ParametersSerum magnesium with high dose therapy or in patients with impaired renal function; serum salicylate levels, renal function, hearing changes or tinnitus, abnormal bruising, weight gain and response (ie, pain)

Reference RangeSalicylate blood levels for anti-inflammatory effect: 150-300 mcg/mL; analgesia and antipyretic effect: 30-50 mcg/mL

Nursing: Physical Assessment/Monitoring**Do not use for persons with allergic reaction to salicylates or other NSAIDs.** Assess other medications patient may be taking for additive or adverse interactions. Monitor for effectiveness of pain relief. Monitor for signs of adverse reactions or overdose at beginning of therapy and periodically during long-term therapy. Assess knowledge/teach patient appropriate use. Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects.

Monitoring: Lab TestsSerum magnesium with high-dose therapy or in patients with impaired renal function, serum salicylate levels, renal function

Patient EducationUse exactly as directed; do not increase dose or frequency. Adverse reactions can occur with overuse. Take with food or milk. While using this medication, do not use alcohol, excessive amounts of vitamin C, or salicylate-containing foods (curry powder, prunes, raisins, tea, or licorice), other prescription or OTC medications containing aspirin or salicylate, or other NSAIDs without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nausea, vomiting, gastric discomfort (frequent mouth care, small frequent meals, sucking lozenges, or chewing gum may help). GI bleeding, ulceration, or perforation can occur with or without pain. Stop taking medication and report ringing in ears; persistent stomach pain; unresolved nausea or vomiting; respiratory difficulty or shortness of breath; or unusual bruising or bleeding (mouth, urine, stool); or skin rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid: 500 mg/5 mL (240 mL) [choline salicylate 293 mg and magnesium salicylate 362 mg per 5 mL; cherry cordial flavor]

Tablet: 500 mg [choline salicylate 293 mg and magnesium salicylate 362 mg]; 750 mg [choline salicylate 440 mg and magnesium salicylate 544 mg]; 1000 mg [choline salicylate 587 mg and magnesium salicylate 725 mg]

Generic AvailableYes

ManufacturerPurdue Frederick Co

Pricing: U.S. (www.drugstore.com)

Tablets (Choline & Mag Trisalicylate)

500 mg (60): $20.99

1000 mg (60): $24.99

Mechanism of ActionWeakly inhibits cyclooxygenase enzymes, which result in decreased formation of prostaglandin precursors; antipyretic, analgesic, and anti-inflammatory properties.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: ~2 hours

Absorption: Stomach and small intestines

Distribution: Readily into most body fluids and tissues; crosses placenta; enters breast milk

Half-life elimination (dose dependent): Low dose: 2-3 hours; High dose: 30 hours

Time to peak, serum: ~2 hours

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation; may rarely cause nervousness or insomnia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsSalicylate salts do not inhibit platelet aggregation and, therefore, should not be substituted for aspirin in the prophylaxis of thrombosis.

Index TermsTricosal

CHOP

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category Chemotherapy Regimen, Lymphoma, non-Hodgkin's

Regimen Use Lymphoma, non-Hodgkin's

Regimen NOTE: Multiple variations are listed below.

Variation 1:

Cyclophosphamide: I.V.: 750 mg/m^2 day 1

[total dose/cycle = 750 mg/m^2]

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2 (maximum 2 mg) day 1

[total dose/cycle = 1.4 mg/m^2]

Prednisone: Oral: 100 mg/day days 1 to 5

[total dose/cycle = 500 mg]

or 50 mg/m^2/day days 1 to 5

[total dose/cycle = 250 mg/m^2]

or 100 mg/m^2/day days 1 to 5

[total dose/cycle = 500 mg/m^2]

Repeat cycle every 21 days

Variation 2:

Cyclophosphamide: I.V.: 750 mg/m^2 day 1

[total dose/cycle = 750 mg/m^2]

Doxorubicin: I.V.: 50 mg/m^2 day 1

[total dose/cycle = 50 mg/m^2]

Vincristine: I.V.: 2 mg day 1

[total dose/cycle = 2 mg]

Prednisone: Oral: 75 mg/day days 1 to 5

[total dose/cycle = 375 mg]

Repeat cycle every 21 days

Variation 3:

Cyclophosphamide: I.V.: 750 mg/m^2/day days 1 and 8

[total dose/cycle = 1500 mg/m^2]

Doxorubicin: I.V.: 25 mg/m^2/day days 1 and 8

[total dose/cycle = 50 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2/day (maximum 2 mg) days 1 and 8

[total dose/cycle = 2.8 mg/m^2]

Prednisone: Oral: 50 mg/m^2/day days 1 to 8

[total dose/cycle = 400 mg/m^2]

Repeat cycle every 28 days

Variation 4 - “mini-CHOP”:

Cyclophosphamide: I.V.: 250 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 750 mg/m^2]

Doxorubicin: I.V.: 16.7 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 50.1 mg/m^2]

Vincristine: I.V.: 0.67 mg/day days 1, 8, and 15

[total dose/cycle = 2.01 mg]

Prednisone: Oral: 75 mg/day days 1 to 5

[total dose/cycle = 375 mg]

Repeat cycle every 21 days

Chorionic Gonadotropin (Human)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(kor ee ON ik goe NAD oh troe pin, HYU man)

U.S. Brand NamesNovarel®; Pregnyl®

Canadian Brand NamesHumegon®; Pregnyl®; Profasi® HP

Pharmacologic CategoryGonadotropin; Ovulation Stimulator

Use: Labeled IndicationsInduces ovulation and pregnancy in anovulatory, infertile females; treatment of hypogonadotropic hypogonadism, prepubertal cryptorchidism; spermatogenesis induction with follitropin alfa

Dosing: Adults

Induction of ovulation: Females: I.M.: 5000-10,000 units 1 day following last dose of menotropins

Spermatogenesis induction associated with hypogonadotropic hypogonadism: Males: Treatment regimens vary (range: 1000-2000 units 2-3 times a week). Administer hCG until serum testosterone levels are normal (may require 2-3 months of therapy), then may add follitropin alfa or menopausal gonadotropin if needed to induce spermatogenesis; continue hCG at the dose required to maintain testosterone levels.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricVarious regimens:

Prepubertal cryptorchidism: I.M.:

4000 units 3 times/week for 3 weeks **or**

5000 units every second day for 4 injections **or**

500 units 3 times/week for 4-6 weeks **or**

15 injections of 500-1000 units given over 6 weeks

Hypogonadotropic hypogonadism: Males: I.M.:

500-1000 units 3 times/week for 3 weeks, followed by the same dose twice weekly for 3 weeks **or**

4000 units 3 times/week for 6-9 months, then reduce dosage to 2000 units 3 times/week for additional 3 months

Administration: I.M.I.M. administration only

ReconstitutionFollowing reconstitution with the provided diluent, solutions are stable for 30-60 days, depending on the specific preparation, when stored at 2°C to 15°C.

ContraindicationsHypersensitivity to chorionic gonadotropin or any component of the formulation; precocious puberty; prostatic carcinoma or similar neoplasms; pregnancy

Warnings/Precautions

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Cryptorchidism: May induce precocious puberty in children being treated for cryptorchidism; discontinue if signs of precocious puberty occur.
- Migraine: Use with caution in patients with a history of migraines.
- Obesity: **Not** effective in the treatment of obesity.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorders: Use with caution in patients with a history of seizure disorders.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <4 years of age.

Other warnings/precautions:

- Ovulation induction: Appropriate use: These medications should only be used by physicians who are thoroughly familiar with infertility problems and their management. May cause ovarian hyperstimulation syndrome (OHSS); characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If severe hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly with 24 hours to several days and generally occurs during the 7-10 days immediately following treatment. Ovarian enlargement ay be accompanied by abdominal distention or abdominal pain and generally regresses without treatment within 2-3 weeks. If ovaries are abnormally enlarged on the last day of treatment, withhold hCG to reduce the risk of OHSS. In association with and separate from OHSS, thromboembolic events have been reported. May result from the use of these medications; advise patients of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsTeratogenic effects (forelimb, CNS) have been noted in animal studies at doses intended to induce superovulation (used in combination with gonadotropin). Testicular tumors in otherwise healthy men have been reported when treating secondary infertility.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema

Central nervous system: Depression, fatigue, headache, irritability, restlessness

Endocrine & metabolic: Gynecomastia, precocious puberty

Local: Injection site reaction

Miscellaneous: Hypersensitivity reaction (local or systemic)

Drug InteractionsThere are no known significant interactions.

Monitoring Parameters

Male: Serum testosterone levels, semen analysis

Female: Ultrasound and/or estradiol levels to assess follicle development; ultrasound to assess number and size of follicles; ovulation (basal body temperature, serum progestin level, menstruation, sonography)

Reference RangeDepends on application and methodology; <3 mIU/mL (SI: <3 units/L) usually normal (nonpregnant)

Nursing: Physical Assessment/MonitoringAssess therapeutic effectiveness (according to purpose for use) and adverse response regularly during long-term therapy. Teach patient proper use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab Tests

Male: Serum testosterone levels, semen analysis

Female: Serum progestin level (ovulation)

Patient EducationThis medication can only be administered by injection. If self-administered, follow instruction for reconstitution, injection, and needle disposal. Use exactly as directed; do not alter dosage or miss a dose. May cause headache, depression, irritability, or restlessness (use caution when driving or engaging in potentially hazardous tasks until response to drug is known). Contact prescriber if symptoms are severe or do not resolve with use. Contact prescriber if breasts swell; if you experience swelling of legs or feet; or if there is pain, redness, or swelling at injection site. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 10,000 units [packaged with diluent; diluent contains benzyl alcohol and mannitol]

Novarel®: 10,000 units [packaged with diluent; diluent contains benzyl alcohol and mannitol]

Pregnyl®: 10,000 units [packaged with diluent; diluent contains benzyl alcohol]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Injection (reconstituted) (Novarel)

10,000 unit/10 mL (1): $44.09

Injection (reconstituted) (Pregnyl)

10,000 unit (1): $43.45

Mechanism of ActionLuteinizing hormone obtained from the urine of pregnant women. Stimulates production of gonadal steroid hormones by causing production of androgen by the testes; as a substitute for luteinizing hormone (LH) to stimulate ovulation

Pharmacodynamics/Kinetics

Half-life elimination: Biphasic: Initial: 11 hours; Terminal: 23 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or depression; rarely may cause restlessness or irritability

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCG; hCG

U.S. Brand NamesOvidrel®
Canadian Brand NamesOvidrel®
Pharmacologic CategoryGonadotropin; Ovulation Stimulator
Use: Labeled IndicationsAs part of an assisted reproductive technology (ART) program, induces ovulation in infertile females who have been pretreated with follicle stimulating hormones (FSH); induces ovulation and pregnancy in infertile females when the cause of infertility is functional
Dosing: AdultsAssisted reproductive technologies (ART) and ovulation induction in females: SubQ: 250 mcg given 1 day following the last dose of follicle stimulating agent. Use only after adequate follicular development has been determined. Hold treatment when there is an excessive ovarian response.
Dosing: ElderlySafety and efficacy have not been established.
Dosing: Renal ImpairmentSafety and efficacy have not been established.
Dosing: Hepatic ImpairmentSafety and efficacy have not been established.
Administration: OtherFor SubQ use only; inject into stomach area.
StoragePrefilled syringe: Prior to dispensing, store at 2°C to 8°C (36°F to 46°F). Patient may store at 25°C (77°F) for up to 30 days. Protect from light.
ContraindicationsHypersensitivity to hCG preparations or any component of the formulation; primary ovarian failure; uncontrolled thyroid or adrenal dysfunction; uncontrolled organic intracranial lesion (ie, pituitary tumor); abnormal uterine bleeding, ovarian cyst or enlargement of undetermined origin; sex hormone dependent tumors; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Ovarian enlargement: May be accompanied by abdominal distention or abdominal pain and generally regresses without treatment within 2-3 weeks. If ovaries are abnormally enlarged on the last day of treatment, withhold hCG to reduce the risk of ovarian hyperstimulation syndrome (OHSS).

- Ovarian hyperstimulation syndrome (OHSS): OHSS is characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If severe hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly with 24 hours to several days and generally occurs during the 7-10 days immediately following treatment.

- Thromboembolism: In association with and separate from ovarian hyperstimulation syndrome (OHSS), arterial thromboembolic events have been reported.

Special populations:

- Elderly: Safety and efficacy have not been established in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: These medications should only be used by physicians who are thoroughly familiar with infertility problems and their management.

- Multiple births: May result from the use of these medications; advise patients of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX
Pregnancy ConsiderationsIntrauterine death and impaired birth were observed in animal studies. Ectopic pregnancy, premature labor, postpartum fever, and spontaneous abortion have been reported in clinical trials. Congenital abnormalities have also been observed, however, the incidence is similar during natural conception.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

2% to 10%:

Endocrine & metabolic: Ovarian cyst (3%), ovarian hyperstimulation (<2% to 3%)

Gastrointestinal: Abdominal pain (3% to 4%), nausea (3%), vomiting (3%)

Local: Injection site: Pain (8%), bruising (3% to 5%), reaction (<2% to 3%), inflammation (<2% to 2%)

Miscellaneous: Postoperative pain (5%)

<2%:

Cardiovascular: Cardiac arrhythmia, heart murmur

Central nervous system: Dizziness, emotional lability, fever, headache, insomnia, malaise

Dermatologic: Pruritus, rash

Endocrine & metabolic: Breast pain, hot flashes, hyperglycemia, intermenstrual bleeding, vaginal hemorrhage

Gastrointestinal: Abdominal enlargement, diarrhea, flatulence

Genitourinary: Cervical carcinoma, cervical lesion, dysuria, genital herpes, genital moniliasis, leukorrhea, urinary incontinence, urinary tract infection, vaginal discomfort, vaginal hemorrhage, vaginitis

Hematologic: Leukocytosis

Neuromuscular & skeletal: Back pain, paresthesia

Renal: Albuminuria

Respiratory: Cough, pharyngitis, upper respiratory tract infection

Miscellaneous: Ectopic pregnancy, hiccups

Postmarketing and/or case reports: Allergic reaction

In addition, the following have been reported with menotropin therapy: Adnexal torsion, hemoperitoneum, mild-to-moderate ovarian enlargement, pulmonary and vascular complications. Ovarian neoplasms have also been reported (rare) with multiple drug regimens used for ovarian induction (relationship not established).

Drug InteractionsThere are no known significant interactions.

Test InteractionsMay interfere with interpretation of pregnancy tests; may cross-react with radioimmunoassay of luteinizing hormone and other gonadotropins

Monitoring ParametersUltrasound and/or estradiol levels to assess follicle development; ultrasound to assess number and size of follicles; ovulation (basal body temperature, serum progestin level, menstruation, sonography)

Nursing: Physical Assessment/MonitoringFor use only under the supervision/direction of an infertility prescriber. Monitor for adverse reactions. Teach patient proper use if self-administered (storage, reconstitution, injection technique, needle/syringe disposal; recommend return demonstration), monitoring requirements, interventions to reduce side effects, and adverse reactions to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment and monitor ovulation closely during treatment.

Monitoring: Lab TestsUltrasound and/or estradiol levels to assess follicle development; ultrasound to assess number and size of follicles; ovulation (basal body temperature, serum progestin level, menstruation, sonography)

Patient EducationNote that there is a risk of multiple births associated with treatment. This drug must be administered exactly as scheduled (1 day following last dose of follicle stimulating agent); maintain a calendar of treatment days. Follow administration directions exactly. Keep all ultrasound and laboratory appointments as instructed by prescriber. Avoid strenuous exercise, especially those with pelvic involvement. You may experience nausea, vomiting, or GI upset (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help), hot flashes (cool clothes, cool room, adequate rest may help); if persistent consult prescriber. Report immediately any persistent abdominal pain, vomiting, or acute pelvic pain; chest pain or palpitations; shortness of breath; or urinary tract or vaginal infection or urinary incontinence. **Pregnancy/breast-feeding precautions:** Do not take this medicine if you are pregnant and report to prescriber immediately if you suspect you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Ovidrel®: 257.5 mcg/0.515 mL (0.515 mL) [prefilled syringe; delivers 250 mcg r-hCG/0.5 mL]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Injection (Ovidrel)

250 mcg/0.5 mL (0.5): $84.97

Mechanism of ActionLuteinizing hormone analogue produced by recombinant DNA techniques; stimulates late follicular maturation and intitates rupture of the ovarian follicle once follicular development has occurred

Pharmacodynamics/Kinetics

Distribution: V_d: 21.4L

Bioavailability: 40%

Half-life elimination: Initial: 4 hours; Terminal: 29 hours

Time to peak: 12-24 hours

Excretion: Urine (10% of dose)

Pharmacotherapy PearlsClinical studies have shown r-hCG to be clinically and statistically equivalent to urinary-derived hCG products.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, emotional lability, and insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Ciclesonide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(sye KLES oh nide)
U.S. Brand NamesAlvesco®; Omnaris™
Canadian Brand NamesAlvesco®; Omnaris™
Pharmacologic CategoryCorticosteroid, Inhalant (Oral); Corticosteroid, Nasal
Use: Labeled Indications

Intranasal: Management of seasonal and perennial allergic rhinitis

Oral inhalation: Prophylactic management of bronchial asthma

Dosing: Adults

Asthma: Oral inhalation (Alvesco®): **Note:** Titrate to the lowest effective dose once asthma stability is achieved:

U.S. labeling:

Prior therapy with bronchodilators alone: Initial: 80 mcg twice daily (maximum dose: 320 mcg/day)

Prior therapy with inhaled corticosteroids: Initial: 80 mcg twice daily (maximum dose: 640 mcg/day)

Prior therapy with oral corticosteroids: Initial: 320 mcg twice daily (maximum dose: 640 mcg/day)

Canadian labeling: Initial: 400 mcg once daily; maintenance: 100-800 mcg/day (1-2 puffs once or twice daily)

Perennial allergic rhinitis: Intranasal (Omnaris™): 2 sprays (50 mcg/spray) per nostril once daily; maximum: 200 mcg/day

Seasonal allergic rhinitis: Intranasal (Omnaris™):

U.S. labeling: 2 sprays (50 mcg/spray) per nostril once daily; maximum: 200 mcg/day

Canadian labeling: 2 sprays (50 mcg/spray) per nostril once daily; maximum: 200 mcg/day

Conversion from oral to inhaled steroid: Initiation of oral inhalation therapy should begin in patients who have previously been stabilized on oral corticosteroids (OCS). A gradual dose reduction of OCS should begin ~7-10 days after starting inhaled therapy. U.S. labeling recommends reducing prednisone dose no more rapidly than ≤2.5 mg/day on a weekly basis. The Canadian labeling recommends decreasing the daily dose of prednisone by 1 mg (or equivalent of other OCS) every 7 days in closely monitored patients, and every 10 days in patients whom close monitoring is not possible. In the presence of withdrawal symptoms, resume previous OCS dose for 1 week before attempting further dose reductions.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Asthma: Oral inhalation (Alvesco®): **Note:** Titrate to the lowest effective dose once asthma stability is achieved:

U.S. labeling: Children ≥12 years: Refer to adult dosing.

Canadian labeling: Children ≥12 years: Refer to adult dosing.

Perennial allergic rhinitis: Intranasal (Omnaris™): Children ≥12 years: Refer to adult dosing:

Seasonal allergic rhinitis: Intranasal (Omnaris™):

U.S. labeling: Children ≥6 year: Refer to adult dosing.

Canadian labeling: Children ≥12 years: Refer to adult dosing.

Administration: InhalationOral inhalation: Remove mouthpiece cover, place inhaler in mouth, close lips around mouthpiece, and inhale slowly and deeply. Press down on top of inhaler after slow inhalation has begun. Remove inhaler while holding breath for approximately 10 seconds. Breathe out slowly and replace mouthpiece on inhaler. Do not wash or place inhaler in water. Clean mouthpiece using a dry cloth or tissue once weekly. Discard after the "discard by" date or after labeled number of doses has been used, even if container is not completely empty.

Shaking is not necessary since drug is formulated as a solution aerosol. Prime inhaler prior to initial use or if not in use for ≥1 week by releasing 3 puffs into the air.

Administration: OtherIntranasal: Shake bottle gently before using. Prime pump prior to first use (press 8 times until fine mist appears) or if spray has not been used in 4 consecutive days (press 1 time or until a fine mist appears). Blow nose to clear nostrils. Insert applicator into nostril, keeping bottle upright, and close off the other nostril. Breathe in through nose. While inhaling, press pump to release spray. Avoid spraying directly onto the nasal septum. Nasal applicator may be removed and rinsed with warm water to clean. Discard after the "discard by" date or after labeled number of doses has been used, even if bottle is not completely empty.

StorageStore at 15°C to 30°C (59°F to 86°F); do not freeze. Nasal spray: Use within 4 months after opening aluminum pouch.

ContraindicationsHypersensitivity to ciclesonide or any component of the formulation

Oral inhalation (Alvesco®): Primary treatment of acute asthma or status asthmaticus; moderate-to-severe bronchiectasis

Canadian labeling (Alvesco®): Additional contraindications (not in U.S. labeling): Untreated fungal, bacterial, or tuberculosis infections of the respiratory tract; moderate-to-severe bronchiectasis

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: May cause hypercorticism or suppression of hypothalamic-pituitary-adrenal (HPA) axis, particularly in younger children or in patients receiving high doses for prolonged periods. HPA axis suppression may lead to adrenal crisis. Withdrawal and discontinuation of a corticosteroid should be done slowly and carefully. Particular care is required when patients are transferred from systemic corticosteroids to inhaled products due to possible adrenal insufficiency or withdrawal from steroids, including an increase in allergic symptoms. Patients receiving >20 mg per day of prednisone (or equivalent) may be most susceptible. Fatalities have occurred due to adrenal insufficiency in asthmatic patients during and after transfer from systemic corticosteroids to aerosol steroids; aerosol steroids do **not** provide the systemic steroid needed to treat patients having trauma, surgery, or infections.

- Bronchospasm: May occur with wheezing after inhalation; if this occurs, stop steroid and treat with a fast-acting bronchodilator.

- Delayed wound healing: Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery or nasal trauma until healing has occurred.

- Immunosuppression: Prolonged use of corticosteroids may also increase the incidence of secondary infection, mask acute infection (including fungal infections), prolong or exacerbate viral infections, or limit response to vaccines. Exposure to chickenpox and measles should be avoided; use caution in patients with active or quiescent TB infections (contraindicated in Canada) or in patients with ocular herpes.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Thrush: *Candida albicans* infections (mostly mild to moderate) of the mouth and pharynx may occur with orally-inhaled corticosteroid use; interruption of therapy may be necessary at times while antifungal therapy is employed; advise patients to rinse mouth after use.

- Vasculitis: Rare cases of vasculitis (Churg-Strauss syndrome) or other eosinophilic conditions (eg, vasculitic rash, decreased pulmonary function, cardiac complications) can occur.

Disease-related concerns:

- Asthma: Supplemental steroids (oral or parenteral) may be needed during stress or severe asthma attacks. Not to be used in status asthmaticus or for the relief of acute bronchospasm.

- Hepatic impairment: Dosage adjustments are not necessary in hepatic impairment; use with caution in patients with severe hepatic impairment, including cirrhosis.

- Ocular disease: Use with caution in patients with cataracts and/or glaucoma; increased intraocular pressure, open-angle glaucoma, and cataracts have occurred with prolonged use. Consider routine eye exams in chronic users.

- Osteoporosis: Use with caution in patients with osteoporosis; high doses and/or long-term use of corticosteroids have been associated with increased bone loss and osteoporotic fractures.

- Renal impairment: Use in renally-impaired patients has not been studied.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with adrenal crisis.

- Thyroid disease: Changes in thyroid status may necessitate dosage adjustments; metabolic clearance of corticosteroids increases in hyperthyroid patients and decreases in hypothyroid ones.

Special populations:

- Pediatrics: Orally-inhaled and intranasal corticosteroids may cause a reduction in growth velocity in pediatric patients (~1 cm per year [range 0.3-1.8 cm per year] and related to dose and duration of exposure). To minimize the systemic effects of orally-inhaled and intranasal corticosteroids, each patient should be titrated to the lowest effective dose. Growth should be routinely monitored in pediatric patients. Safety and efficacy of intranasal use have not been established in children <6 years of age and of oral inhalation use in patients <12 years.

Geriatric ConsiderationsNo specific information is available for the elderly patient. Make sure the patient can correctly use the nasal inhaler.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were reported in some, but not all animal studies. There are no adequate and well-controlled studies in pregnant women. The extent of intranasal absorption of ciclesonide systemically is low but variable; use during pregnancy with caution. Hypoadrenalism may occur in infants born to mothers receiving corticosteroids during pregnancy.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (≤11%)

Respiratory: Nasopharyngitis (≤11%)

1% to 10%:

Cardiovascular: Facial edema (≥3%)

Central nervous system: Dizziness (≥3%), fatigue (≥3%)

Dermatologic: Urticaria (≥3%)

Gastrointestinal: Gastroenteritis (≥3%), oral candidiasis (≥3%)

Neuromuscular & skeletal: Arthralgia (≤4%), musculoskeletal chest pain (≥3%), back pain (≥3%), extremity pain (≥3%)

Ocular: Conjunctivitis (≥3%)

Otic: Ear pain (2%)

Respiratory: Upper respiratory infection (≤9%), epistaxis (≤8%), nasal congestion (≤6%), sinusitis (≤6%), pharyngolaryngeal pain (≤ 5%), hoarseness (≥3%), pneumonia (≥3%), paradoxical bronchospasm (2%), dysphonia (1%)

Miscellaneous: Influenza (≥3%)

<1%, postmarketing, and/or case reports: ALT increased, angioedema (with swelling of lip/pharynx/tongue), bruising, candidiasis (nasal/pharyngeal/systemic), cataract, chest discomfort, cough, dry throat, dysgeusia, dyspepsia, GGT increased, intraocular pressure increased, nausea, nasal septum disorder, palpitation, pharyngitis, rash, rhinorrhea, throat irritation, WBC increased, weight gain, xerostomia

Metabolism/Transport Effects **Substrate** of CYP3A4 (major), 2D6 (minor)

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Monitoring Parameters Growth (adolescents) and signs/symptoms of HPA axis suppression/adrenal insufficiency; ocular effects (eg, cataracts, increased intraocular pressure, glaucoma)

Nursing: Physical Assessment/Monitoring Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report. Growth should be monitored periodically with long-term use in children. Do not discontinue abruptly after long-term use.

Patient Education Inform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Take exactly as directed. Do not exceed the recommended dosage. Not intended for treatment of acute asthma attacks. Full response to this medication may not be seen for 2-5 weeks. Use regularly. Do not stop treatment, even if feeling better. You may be susceptible to infections. Avoid exposure to chickenpox or measles, crowds, and exposure to other potential infections. Report persistent headache, nosebleeds, or worsening of condition or lack of improvement. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Aerosol for oral inhalation:

Alvesco® [U.S.]: 80 mcg/inhalation (6.1 g) [60 metered actuations]; 160 mcg/inhalation (6.1 g) [60 metered actuations]

Alvesco® [CAN]: 50 mcg/inhalation [30-, 60-, and 120 metered actuations] [not available in the U.S.]; 100 mcg/inhalation [30-, 60-, and 120 metered actuations] [not available in the U.S.]; 200 mcg/inhalation [30-, 60-, and 120 metered actuations] [not available in the U.S.]

Suspension, intranasal [spray]:

Omnaris™: 50 mcg/inhalation (12.5 g) [120 metered actuations]

Generic Available No

Manufacturer Altana

Pricing: U.S. (www.drugstore.com)

Suspension (Omnaris)

50 mcg/ACT (12.5): $80.99

Mechanism of Action Ciclesonide is a nonhalogenated, glucocorticoid prodrug that is hydrolyzed to the pharmacologically active metabolite des-ciclesonide following administration. Des-ciclesonide has a high affinity for the glucocorticoid receptor and exhibits anti-inflammatory activity. The mechanism of action for corticosteroids is believed to be a combination of three important properties – anti-inflammatory activity, immunosuppressive properties, and antiproliferative actions.

Pharmacodynamics/Kinetics

Onset of action: Intranasal: 24-48 hours; further improvement observed over 1-2 weeks in seasonal allergic rhinitis or 5 weeks in perennial allergic rhinitis

Absorption: Intranasal: Minimal systemic absorption; Oral inhalation: 52% (lung deposition)

Distribution: I.V.: V_d: Ciclesonide 2.9 L/kg; Des-ciclesonide 12.1 L/kg

Protein binding: ≥99%

Metabolism: Ciclesonide hydrolyzed to active metabolite, des-ciclesonide via esterases in nasal mucosa and lungs; further metabolism via hepatic CYP3A4 and 2D6

Bioavailability: Intranasal <1%; oral inhalation: >50% (active metabolite)

Half-life elimination: Oral inhalation: ~5-7 hours

Time to peak: Oral inhalation: ~1 hour (active metabolite)

Excretion:

Intranasal: Feces (~66%); urine (≤20%)

Oral inhalation: Feces (78%)

Pharmacotherapy PearlsThe incidence of oral candidiasis, as well as other localized oropharyngeal effects, observed with ciclesonide use has been reported to be approximately one-half of that seen with other commonly inhaled corticosteroids such as budesonide and fluticasone. Small particle size, minimal activation, and deposition in the oropharynx may explain this decreased incidence.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentPatients may experience symptoms of corticosteroid withdrawal (depression) when replacing a systemic agent with a topical corticosteroid.

Pharmacologic CategoryAntifungal Agent, Topical

Use: Labeled Indications

Cream/suspension: Treatment of tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), cutaneous candidiasis, and tinea versicolor (pityriasis)

Gel: Treatment of tinea pedis (athlete's foot), tinea corporis (ringworm); seborrheic dermatitis of the scalp

Lacquer (solution): Topical treatment of mild-to-moderate onychomycosis of the fingernails and toenails due to *Trichophyton rubrum* (not involving the lunula) and the immediately-adjacent skin

Shampoo: Treatment of seborrheic dermatitis of the scalp

Dosing: Adults

Tinea pedis, tinea corporis: Topical:

Cream and suspension: Apply twice daily, gently massage into affected areas; if no improvement after 4 weeks of treatment, re-evaluate the diagnosis.

Gel: Apply twice daily, gently massage into affected areas and surrounding skin; if no improvement after 4 weeks of treatment, re-evaluate diagnosis

Tinea cruris, cutaneous candidiasis, and tinea versicolor: Topical: *Cream and suspension:* Apply twice daily, gently massage into affected areas; if no improvement after 4 weeks of treatment, re-evaluate the diagnosis.

Onychomycosis of the fingernails and toenails: Topical: *Lacquer (solution):* Apply to adjacent skin and affected nails daily (as a part of a comprehensive management program for onychomycosis). Remove with alcohol every 7 days.

Seborrheic dermatitis of the scalp: Topical:

Gel: Apply twice daily, gently massage into affected areas and surrounding skin; if no improvement after 4 weeks of treatment, re-evaluate diagnosis.

Shampoo: Apply ~5 mL (1 teaspoonful) to wet hair; lather, and leave in place ~3 minutes; rinse. May use up to 10 mL for longer hair. Repeat twice weekly for 4 weeks; allow a minimum of 3 days between applications.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Tinea pedis, tinea corporis: Topical:

Cream and suspension: Children >10 years: Refer to adult dosing.

Gel: Children >16 years: Refer to adult dosing.

Tinea cruris, cutaneous candidiasis, and tinea versicolor: Topical: *Cream and suspension:* Children >10 years: Refer to adult dosing.

Onychomycosis of the fingernails and toenails: Topical: *Lacquer (solution):* Children ≥12 years: Refer to adult dosing.

Seborrheic dermatitis of the scalp: Topical: *Gel and shampoo:* Children >16 years: Refer to adult dosing.

Administration: Topical

Cream, suspension: Gently massage into affected areas.

Gel: Gently massage into affected areas and adjacent skin.

Lacquer (solution): Apply evenly over nail and surrounding skin at bedtime (or allow 8 hours before washing); apply daily over previous coat for 7 days; after 7 days, may remove with alcohol and continue cycle.

Shampoo: Apply to wet hair; lather and leave in place for ~3 minutes; rinse.

Storage

Cream, suspension: Store between 5°C to 25°C (41°F to 77°F).

Lacquer (solution): Store at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light. Flammable; keep away from heat and flame.

Gel, shampoo: Store at room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to ciclopirox or any component of the formulation; avoid occlusive wrappings or dressings

Allergy Considerations

- Ciclopirox Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occurs.

Special populations:

- Immunocompromised patients: Use has not been evaluated in immunosuppressed or immunocompromised patients.
- Pediatrics: Topical cream and suspension not approved for use in children <10 years of age. Nail lacquer (solution) not approved for use in children <12 years of age. Shampoo and gel not approved for use in children <16 years of age.

Dosage form specific issues:

- Nail lacquer: For topical use only and has not been studied in conjunction with systemic therapy or in patients with type 1 diabetes mellitus (insulin dependent, IDDM).

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies, however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Central nervous system: Headache

Dermatologic: Alopecia, dry skin, erythema, facial edema, hair discoloration (rare; shampoo formulation in light-haired individuals), nail disorder (shape or color change with lacquer), pruritus, rash

Local: Burning sensation (gel: 34%; ≤1% with other forms), irritation, redness, or pain

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, topical, as olamine: 0.77% (15 g, 30 g, 90 g)

Loprox®: 0.77% (15 g, 30 g, 90 g) [contains benzyl alcohol] [DSC]

Gel, topical: 0.77% (30 g, 45 g, 100 g)

Loprox®: 0.77% (30 g, 45 g, 100 g) [contains isopropyl alcohol]

Shampoo, topical:

Loprox®: 1% (120 mL)

Solution, topical [nail lacquer]: 8% (6.6 mL)

Penlac®: 8% (6.6 mL) [contains isopropyl alcohol]

Suspension, topical, as olamine: 0.77% (30 mL, 60 mL)

Loprox®: 0.77% (30 mL, 60 mL) [contains benzyl alcohol] [DSC]

Generic AvailableYes: Excludes shampoo

Pricing: U.S. (www.drugstore.com)

Mechanism of ActionInhibiting transport of essential elements in the fungal cell disrupting the synthesis of DNA, RNA, and protein

Pharmacodynamics/Kinetics

Absorption: Cream, suspension: <2% through intact skin; increased with gel; <5% with lacquer

Distribution: Scalp application: To epidermis, corium (dermis), including hair, hair follicles, and sebaceous glands

Protein binding: 94% to 98%

Half-life elimination: Biologic: 1.7 hours (suspension); elimination: 5.5 hours (gel)

Excretion: Urine (gel: 3% to 10%); feces (small amounts)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCiclopirox Olamine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(si DOF o veer)

U.S. Brand NamesVistide®

Pharmacologic CategoryAntiviral Agent

Use: Labeled IndicationsTreatment of cytomegalovirus (CMV) retinitis in patients with acquired immunodeficiency syndrome (AIDS). **Note:** Should be administered with probenecid.

Dosing: AdultsTreatment of cytomegalovirus (CMV) retinitis: I.V.:

Induction treatment: 5 mg/kg once weekly for 2 consecutive weeks

Maintenance treatment: 5 mg/kg administered once every 2 weeks

Note: Probenecid must be administered orally with each dose of cidofovir.

Probenecid dose: 2 g 3 hours prior to cidofovir dose, 1 g at 2 hours and 8 hours after completion of the infusion; patients should also receive 1 L of normal saline intravenously prior to each infusion of cidofovir; saline should be infused over 1-2 hours.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Changes in renal function during therapy: If the creatinine increases by 0.3-0.4 mg/dL, reduce the cidofovir dose to 3 mg/kg; discontinue therapy for increases ≥0.5 mg/dL or development of ≥3+ proteinuria

Pre-existing renal impairment: Use is contraindicated with serum creatinine >1.5 mg/dL, Cl_{cr} <55 mL/minute, or urine protein ≥100 mg/dL (≥2+ proteinuria)

Administration: I.V.For I.V. infusion only. Infuse over 1 hour. Hydrate with 1 L of 0.9% NS I.V. prior to cidofovir infusion. A second liter may be administered over a 1- to 3-hour period immediately following infusion, if tolerated.

Administration: I.V. DetailpH: 6.7-7.6

StorageStore at controlled room temperature 20°C to 25°C (68°F to 77°F). Store admixtures under refrigeration for ≤24 hours. Cidofovir infusion admixture should be administered within 24 hours of preparation at room temperature or refrigerated. Admixtures should be allowed to equilibrate to room temperature prior to use.

ReconstitutionDilute dose in NS 100 mL prior to infusion.

CompatibilityStable in $D_5{}^1/_4$NS, D_5W, NS.

ContraindicationsHypersensitivity to cidofovir; history of clinically-severe hypersensitivity to probenecid or other sulfa-containing medications; serum creatinine >1.5 mg/dL; Cl_{cr} <55 mL/minute; urine protein ≥100 mg/dL (≥2+ proteinuria); use with or within 7 days of nephrotoxic agents; direct intraocular injection

Warnings/Precautions

Boxed warnings:

- Appropriate use: See “Other warnings/precautions” below.
- Carcinogenic/teratogenic/fertility effects: See “Concerns related to adverse effects” below.
- Nephrotoxicity: See “Concerns related to adverse effects” below.
- Neutropenia: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Carcinogenic/teratogenic/fertility effects: **[U.S. Boxed Warning]: Possibly carcinogenic and teratogenic based on animal data. May cause hypospermia.**
- Metabolic acidosis: Monitor for signs of metabolic acidosis; decreases $NaHCO_3$, proximal tubule injury, and renal wasting have been reported.
- Nephrotoxicity: **[U.S. Boxed Warning]: Dose-dependent nephrotoxicity requires dose adjustment or discontinuation if changes in renal function occur during therapy (eg, proteinuria, glycosuria, decreased serum phosphate, uric acid or bicarbonate, and elevated creatinine).** Administration must be accompanied by oral probenecid and intravenous saline prehydration.
- Neutropenia: **[U.S. Boxed Warning]: Neutropenia has been reported;** monitor counts during therapy.

- Ocular hypotony: Cases of ocular hypotony have also occurred; monitor intraocular pressure.

Special populations:

- Elderly: Use with caution in the elderly; safety and efficacy have not been established.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Indicated only for CMV retinitis treatment in HIV patients.**

Geriatric ConsiderationsSince elderly individuals frequently have reduced kidney function, particular attention should be paid to assessing renal function before and frequently during administration.

Pregnancy Risk FactorC

Pregnancy Considerations**[U.S. Boxed Warning]: Possibly carcinogenic and teratogenic based on animal data. May cause hypospermia.** Cidofovir was shown to be teratogenic and embryotoxic in animal studies, some at doses which also produced maternal toxicity. Reduced testes weight and hypospermia were also noted in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus. Women of childbearing potential should use effective contraception during therapy and for 1 month following treatment. Males should use a barrier contraceptive during therapy and for 3 months following treatment.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsThe CDC recommends **not** to breast-feed if diagnosed with HIV to avoid postnatal transmission of the virus.

Adverse Reactions

>10%:

Central nervous system: Chills, fever, headache, pain

Dermatologic: Alopecia, rash

Gastrointestinal: Nausea, vomiting, diarrhea, anorexia

Hematologic: Anemia, neutropenia

Neuromuscular & skeletal: Weakness

Ocular: Intraocular pressure decreased, iritis, ocular hypotony, uveitis

Renal: Creatinine increased, proteinuria, renal toxicity

Respiratory: Cough, dyspnea

Miscellaneous: Infection, oral moniliasis, serum bicarbonate decreased

1% to 10%:

Renal: Fanconi syndrome

Respiratory: Pneumonia

<1%: Hepatic failure, metabolic acidosis, pancreatitis

Frequency not defined (limited to important or life-threatening reactions):

Cardiovascular: Cardiomyopathy, cardiovascular disorder, CHF, edema, postural hypotension, shock, syncope, tachycardia

Central nervous system: Agitation, amnesia, anxiety, confusion, convulsion, dizziness, hallucinations, insomnia, malaise, vertigo

Dermatologic: Photosensitivity reaction, skin discoloration, urticaria

Endocrine & metabolic: Adrenal cortex insufficiency

Gastrointestinal: Abdominal pain, aphthous stomatitis, colitis, constipation, dysphagia, fecal incontinence, gastritis, GI hemorrhage, gingivitis, melena, proctitis, splenomegaly, stomatitis, tongue discoloration

Genitourinary: Urinary incontinence

Hematologic: Hypochromic anemia, leukocytosis, leukopenia, lymphadenopathy, lymphoma-like reaction, pancytopenia, thrombocytopenia, thrombocytopenic purpura

Hepatic: Hepatomegaly, hepatosplenomegaly, jaundice, liver function tests abnormal, liver damage, liver necrosis

Local: Injection site reaction

Neuromuscular & skeletal: Tremor

Ocular: Amblyopia, blindness, cataract, conjunctivitis, corneal lesion, diplopia, vision abnormal

Otic: Hearing loss

Miscellaneous: Allergic reaction, sepsis

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersRenal function (Cr, BUN, UAs) within 48 hours of each dose, LFTs, WBCs; intraocular pressure and visual acuity, signs and symptoms of uveitis/iritis

Nursing: Physical Assessment/MonitoringAssess patient allergy history (sulfa) prior to beginning therapy. Administration must be accompanied by oral probenecid and intravenous saline prehydration. Assess other pharmacological or herbal products patient may be taking for potential interactions (especially anything that may be nephrotoxic). Infusion site should be monitored closely to avoid extravasation. Assess results of laboratory tests with each dose. Assess therapeutic effectiveness and adverse response (eg, CNS changes, anemia, interocular pressure, renal damage, proteinuria, elevated creatine) regularly during therapy. For patients with diabetes, serum glucose should be monitored closely (may cause hyperglycemia). Teach patient possible side effects/appropriate interventions and adverse symptoms to report (especially any changes in vision or eye pain).

Monitoring: Lab TestsSerum creatinine, serum bicarbonate, acid-base status, urine protein, WBC should be monitored with each dose; monitor intraocular pressure frequently.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. This drug can only be administered I.V. Report immediately any pain, stinging, swelling at infusion site. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause hair loss (reversible); headache, anxiety, confusion (use caution when driving or engaging in tasks that require alertness until response to drug is known); diarrhea (buttermilk or yogurt may help); nausea, heartburn, or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased exercise, fluids, fruit, or fiber may help); or postural hypotension (use caution changing from lying to sitting or standing position and when climbing stairs). Report severe unresolved vomiting, constipation, or diarrhea; chills, fever, signs of infection; respiratory difficulty or unusual coughing; palpitations, chest pain, or syncope; CNS changes (eg, hallucinations, depression, excessive sedation, amnesia, seizures, insomnia); vision changes; or other severe side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant and do not get pregnant while taking this medicine. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptives if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 75 mg/mL (5 mL)

Generic AvailableNo

Mechanism of ActionCidofovir is converted to cidofovir diphosphate which is the active intracellular metabolite; cidofovir diphosphate suppresses CMV replication by selective inhibition of viral DNA synthesis. Incorporation of cidofovir into growing viral DNA chain results in reductions in the rate of viral DNA synthesis.

Pharmacodynamics/KineticsThe following pharmacokinetic data is based on a combination of cidofovir administered with probenecid:

Distribution: V_d: 0.54 L/kg; does not cross significantly into CSF

Protein binding: <6%

Metabolism: Minimal; phosphorylation occurs intracellularly

Half-life elimination, plasma: ~2.6 hours

Excretion: Urine

Cilazapril and Hydrochlorothiazide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sye LAY za pril & hye droe klor oh THYE a zide)

Canadian Brand NamesApo-Cilazapril/Hctz; Inhibace® Plus

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of mild-to-moderate hypertension in patients who have been stabilized on the individual agents given in the same proportions; not indicated for initial treatment of hypertension

Dosing: Adults**Note:** Initiate therapy with combination product only after successful titration of individual agents to adequate blood pressure response.

Hypertension: Oral: One tablet administered once daily; dose is individualized (range: Cilazapril: 2.5-10 mg; hydrochlorothiazide: 6.25-25 mg/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild-to-moderate renal impairment: Use with caution; reduced dosage may be appropriate

Cl_{cr} <30 mL/minute: Not recommended

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to cilazapril, hydrochlorothiazide, or any component of the formulation; hypersensitivity to other ACE inhibitors, thiazides or sulfonamide-derived drugs, angioedema related to previous treatment with an ACE inhibitor; anuria; pregnancy; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising the airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Use with extreme caution in patients with idiopathic or hereditary angioedema. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.
- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.
- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.
- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.
- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.
- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.
- Hypovolemia: Use with caution in patients with hypovolemia; hypotension can occur. Carefully monitor blood pressure with the first dose.
- Porphyria: Use with caution in patients with porphyria; acute porphyritic attacks have occurred with hydrochlorothiazide.
- Renal artery stenosis: Use cilazapril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

Dosage form specific issues:

- Lactose: Contains lactose; avoid use in patients with galactose intolerance, Lapp lactase deficiency or glucose-galactose malabsorption.

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy ConsiderationsUse is contraindicated. See individual agents.
LactationExcretion in breast milk unknown/contraindicated
Adverse Reactions

1% to 10%:

Cardiovascular: Palpitation (1%)

Central nervous system: Dizziness (4%), fatigue (3%), somnolence (1%)

Gastrointestinal: Nausea (1%)

Genitourinary: Polyuria (1%)

Hematologic: Transient neutropenia (1%)

Hepatic: Transaminases increased (≤1%)

Respiratory: Cough (3%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abdominal pain, acute interstitial pneumonitis, acute pulmonary edema, acute renal failure, agranulocytosis, alkaline phosphatase increased, alopecia, angina, angioedema, anorexia, anxiety, arthralgia, atrial fibrillation, back pain, bleeding time increased, bradycardia, bronchitis, BUN increased, cerebrovascular disorder, cholestatic hepatitis (with or without necrosis), confusion, constipation, depersonalization, depression, dermatitis, diaphoresis, diplopia, dreaming abnormal, dyspepsia, dyspnea, erythema multiforme, extrasystoles, facial edema, fever, flatulence, GGT increased, gout, hemolytic anemia, hot flushes, hyperbilirubinemia, hypoesthesia, hyponatremia, hypotension (including postural), hypothermia, impotence, insomnia, leg cramps, leukorrhea, libido decreased/increased, malaise, melena, MI, myalgia, nervousness, neurosis, nocturia, pain, pancreatitis, paresthesia, paroniria, pemphigus, peripheral edema, peripheral ischemia, pharyngitis, pruritus, pseudoporphyria, purpura, rash, rhinitis, rigors, sinusitis, Stevens-Johnson syndrome, stroke, tachycardia, taste disorder, thrombocytopenia, tinnitus, toxic epidermal necrolysis, transaminases increased, upper respiratory tract infection, vasodilation, vertigo, vision abnormal, vomiting, weakness, weight gain, xerostomia

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet: 5/12.5: Cilazapril monohydrate 5 mg and hydrochlorothiazide 12.5 mg [not available in the U.S.]

Inhibace® Plus 5/12.5 [CAN]: Cilazapril monohydrate 5 mg and hydrochlorothiazide 12.5 mg [not available in the U.S.; contains lactose]

Generic AvailableYes

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Cilazapril
- Hydrochlorothiazide

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause sedation, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low-risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after 4 years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by the presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50

mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Index TermsCilazapril Monohydrate and Hydrochlorothiazide; Hydrochlorothiazide and Cilazapril

Cilazapril

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(sye LAY za pril)

Canadian Brand NamesApo-Cilazapril®; CO Cilazapril; Gen-Cilazapril; Inhibace®; Novo-Cilazapril; PMS-Cilazapril

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsManagement of hypertension; treatment of heart failure

Dosing: Adults

Hypertension: Oral: 2.5-5 mg once daily (maximum dose: 10 mg/day)

Congestive heart failure: Oral: Initial: 0.5 mg once daily; if tolerated, after 5 days increase to 1 mg/day (lowest maintenance dose); may increase to maximum of 2.5 mg once daily

Dosing: ElderlyInitial: 1.25 mg once daily; titrate slowly as tolerated

Dosing: Renal Impairment

Hypertension:

Cl_{cr} 10-40 mL/minute: Initial: 0.5 mg once daily (maximum dose: 2.5 mg once daily)

Cl_{cr} <10 mL/minute: 0.25-0.5 mg once or twice weekly

Congestive heart failure:

Cl_{cr} 10-40 mL/minute: Initial: 0.25-0.5 mg once daily (maximum dose: 2.5 mg once daily)

Cl_{cr} <10 mL/minute: 0.25-0.5 mg once or twice weekly

Dosing: Hepatic ImpairmentInitial: ≤0.5 mg once daily (with caution)

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to cilazapril, any other ACE inhibitor, or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor; ascites; pregnancy; breast-feeding

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising the airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Dosage form specific issues:

- Lactose: Contains lactose; avoid use in patients with galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption.

Special populations:

- Pregnancy: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. Use is contraindicated in pregnancy.

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy ConsiderationsCranial defects, hypocalvaria/acalvaria, oligohydramnios, persistent anuria following delivery, hypotension, renal defects, renal dysgenesis/dysplasia, renal failure, pulmonary hypoplasia, limb contractures secondary to oligohydramnios, and fetal death reported. Cilazapril is contraindicated in pregnancy.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

1% to 10%:

Cardiovascular: Palpitation (up to 1%), hypotension (symptomatic, up to 1% in CHF patients), orthostatic hypotension (2%)

Central nervous system: Headache (3% to 5%), dizziness (3% to 8%), fatigue (2% to 3%)

Gastrointestinal: Nausea (1% to 3%)

Neuromuscular & skeletal: Weakness (0.3% to 2%)

Renal: Serum creatinine increased

Respiratory: Cough (2% in hypertension, up to 7.5% in CHF patients)

<1%: Angina, angioedema, anorexia, anxiety, arrhythmia, ataxia, atrial fibrillation, AV block, bradycardia, bronchospasm, cardiogenic shock, confusion, constipation, depression, diarrhea, dyspepsia, dyspnea, dysuria, gout, hemolytic anemia, hyperbilirubinemia, hyperglycemia, hyperkalemia, insomnia, leukopenia, MI, neutropenia, nervousness, pancreatitis, paresthesia, pemphigus, polyuria, proteinuria, pruritus, purpura, rash, renal failure, rhinitis, somnolence, Stevens-Johnson syndrome, stroke, syncope, taste perversion, thrombocytopenic purpura, tinnitus, transaminases increased, tremor, urticaria, vomiting

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Cilazapril serum concentrations may be decreased if taken with food (no apparent effect on activity). Long-term use of ACE inhibitors may result in a zinc deficiency which can result in a decrease in taste perception.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, california poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBUN, electrolytes, serum creatinine; blood pressure. In patients with renal impairment and/or collagen vascular disease, monitor CBC with differential

Monitoring: Lab TestsBUN, electrolytes, serum creatinine; blood pressure; in patients with renal impairment and/or collagen vascular disease, monitor CBC with differential

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Inhibace® [CAN], Novo-Cilazapril [CAN]: 1 mg, 2.5 mg, 5 mg [not available in the U.S.]

Mechanism of ActionCompetitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion.

Pharmacodynamics/Kinetics

Onset of action: Antihypertensive: ~1 hour

Duration: Therapeutic effect: 24 hours

Absorption: Rapid

Metabolism: To active form (cilazaprilat)

Bioavailability: 57%

Half-life elimination: Cilazaprilat: Terminal: 36-49 hours

Time to peak: 3-7 hours

Excretion: In urine (91%)

Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause sedation, insomnia, or depression
Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low-risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after 4 years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by the presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Index TermsCilazapril Monohydrate

Medication Safety Issues

Sound-alike/look-alike issues:

Pletal® may be confused with Plendil®

Pronunciation(sil OH sta zol)

U.S. Brand NamesPletal®

Canadian Brand NamesPletal®

Pharmacologic CategoryAntiplatelet Agent; Phosphodiesterase Enzyme Inhibitor

Use: Labeled IndicationsSymptomatic management of peripheral vascular disease, primarily intermittent claudication

Use: Unlabeled/InvestigationalAdjunct with aspirin and clopidogrel for prevention of stent thrombosis and restenosis after coronary stent placement

Dosing: AdultsPeripheral vascular disease: Oral: 100 mg twice daily

Dosage adjustment for cilostazol with concomitant medications:

CYP2C19 inhibitors (see Drug Interactions): Dosage of cilostazol should be reduced to 50 mg twice daily

CYP3A4 inhibitors (see Drug Interactions): Dosage of cilostazol should be reduced to 50 mg twice daily

Dosing: ElderlyRefer to adult dosing.

Administration: OralAdminister cilostazol 30 minutes before or 2 hours after meals.

Dietary ConsiderationsIt is best to take cilostazol 30 minutes before or 2 hours after meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to cilostazol or any component of the formulation; heart failure (HF) of any severity; hemostatic disorders or active bleeding

Allergy Considerations

- Cilostazol Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Leukopenia: Discontinue therapy if leukopenia occurs; progression to agranulocytosis (reversible) has been reported when cilostazol was not immediately stopped.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with underlying heart disease.
- Hepatic impairment: Use with caution in patients with moderate-to-severe hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment (Cl_{cr} <25 mL/minute).
- Thrombocytopenia: Discontinue therapy if thrombocytopenia occurs; progression to agranulocytosis (reversible) has been reported when cilostazol was not immediately stopped.

Concurrent drug therapy issues:

- Clopidogrel: When cilostazol and clopidogrel are used concurrently, manufacturer recommends checking bleeding times.
- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.
- Platelet aggregation inhibitors: Use with caution in patients receiving other platelet aggregation inhibitors.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Elective surgery: Withhold for at least 4-6 half-lives prior to elective surgical procedures.

Geriatric ConsiderationsElderly must be evaluated for cardiac status. Since CHF is common, this disease cannot be overlooked.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIn animal studies, abnormalities of the skeletal, renal and cardiovascular system were increased. In addition, the incidence of stillbirth and decreased birth weights were increased.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether cilostazol is excreted in human milk. Because of the potential risk to nursing infants, a decision to discontinue the drug or discontinue nursing should be made.

Adverse Reactions

>10%:

Central nervous system: Headache (27% to 34%)

Gastrointestinal: Abnormal stools (12% to 15%), diarrhea (12% to 19%)

Respiratory: Rhinitis (7% to 12%)

Miscellaneous: Infection (10% to 14%)

2% to 10%:

Cardiovascular: Peripheral edema (7% to 9%), palpitation (5% to 10%), tachycardia (4%)

Central nervous system: Dizziness (9% to 10%), vertigo (up to 3%)

Gastrointestinal: Dyspepsia (6%), nausea (6% to 7%), abdominal pain (4% to 5%), flatulence (2% to 3%)

Neuromuscular & skeletal: Back pain (6% to 7%), myalgia (2% to 3%)

Respiratory: Pharyngitis (7% to 10%), cough (3% to 4%)

<2%: Albuminuria, amblyopia, anemia, anorexia, anxiety, arthralgia, asthma, atrial fibrillation, atrial flutter, blindness, bone pain, bursitis, cardiac arrest, cerebral infarction/ischemia, chills, cholelithiasis, colitis, conjunctivitis, CHF, creatinine increased, cystitis, diabetes mellitus, diplopia, dry skin, duodenal ulcer, duodenitis, ear pain, ecchymosis, edema, epistaxis, esophageal hemorrhage, esophagitis, facial edema, fever, gastritis, GGT increased, gout, gum hemorrhage, hematemesis, hemorrhage, hemoptysis, hyperlipidemia, hyperuricemia, hypotension, insomnia, malaise, melena, myocardial infarction/ischemia, neuralgia, nodal arrhythmia, nuchal rigidity, pelvic pain, periodontal abscess, peptic ulcer, pneumonia, polycythemia, postural hypotension, purpura, rectal hemorrhage, retinal hemorrhage, retroperitoneal hemorrhage, sinusitis, supraventricular tachycardia, syncope, tinnitus, tongue edema, urinary frequency, varicose vein, ventricular extrasystole, ventricular tachycardia

Postmarketing and/or case reports: Agranulocytosis, aplastic anemia, blood pressure increased, blood urea increased, cerebrovascular accident, chest pain, coronary stent thrombosis, extradural hematoma, gastrointestinal hemorrhage, granulocytopenia, hepatic dysfunction, hot flashes, hyperglycemia, interstitial pneumonia, intracranial hemorrhage, jaundice, leukopenia, pain, pulmonary hemorrhage, pruritus, QT_c prolongation, subcutaneous hemorrhage, Stevens-Johnson syndrome, subdural hematoma, thrombocytopenia, thrombosis, torsade de pointes, uric acid increased

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C19 (minor), 2D6 (minor), 3A4 (major)

Drug Interactions

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Cilostazol. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D:*

Consider therapy modification

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Omeprazole: May enhance the adverse/toxic effect of Cilostazol. *Risk D: Consider therapy modification*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Taking cilostazol with a high-fat meal may increase peak concentration by 90%. Avoid concurrent ingestion of grapefruit juice due to the potential to inhibit CYP3A4.

Herb/Nutraceutical: St John's wort may decrease the levels/effects of cilostazol. Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, chamomile, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American), ginseng (Panax), ginseng (Siberian), grape seed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationUse exactly as directed; do not discontinue this medication without consulting prescriber. Beneficial effect may take between 2-12 weeks. Take on empty stomach (30 minutes before or 2 hours after meals). Do not take with grapefruit juice. You may experience nervousness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to treatment is known); nausea, vomiting, or flatulence (small frequent meals, frequent mouth care, chewing gum or sucking hard candy may help); or postural hypotension (change position slowly when rising from sitting or lying position or climbing stairs). Report chest pain, palpitations, unusual heartbeat, or swelling of extremities; unusual bleeding; unresolved GI upset or pain; dizziness, nervousness, sleeplessness, or fatigue; muscle cramping or tremor; unusual cough; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 50 mg, 100 mg

Pletal®: 50 mg, 100 mg

Generic AvailableYes

ManufacturerOtsuka America Pharmaceutical

Pricing: U.S. (www.drugstore.com)

Tablets (Cilostazol)

50 mg (60): $82.00

100 mg (60): $26.99

Tablets (Pletal)

50 mg (60): $133.00

100 mg (60): $112.20

Mechanism of ActionCilostazol and its metabolites are inhibitors of phosphodiesterase III. As a result, cyclic AMP is increased leading to reversible inhibition of platelet aggregation, vasodilation, and inhibition of vascular smooth muscle cell proliferation.

Pharmacodynamics/Kinetics

Onset of action: 2-4 weeks; may require up to 12 weeks

Protein binding: Cilostazol 95% to 98%; active metabolites 66% to 97%

Metabolism: Hepatic via CYP3A4 (primarily), 1A2, 2C19, and 2D6; at least one metabolite has significant activity

Half-life elimination: 11-13 hours

Excretion: Urine (74%) and feces (20%) as metabolites

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadache and dizziness are common; may rarely cause anxiety or insomnia

Mental Health: Effects on Psychiatric TreatmentCYP3A4 inhibitors (fluvoxamine, fluoxetine, nefazodone, sertraline) may increase the concentrations of cilostazol

Cardiovascular Considerations

Because of its chronotropic effects, arrhythmogenic effects, and similarity to other phosphodiesterase III inhibitors, cilostazol is contraindicated in patients with HF of any severity.

Anesthesia and Critical Care Concerns/Other ConsiderationsConsidered effective treatment in patients with lower extremity peripheral arterial disease (PAD) and intermittent claudication (in the absence of heart failure). A therapeutic trial should be considered in all patients with lifestyle-limiting claudication.

Cimetidine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Cimetidine may be confused with simethicone

Pronunciation(sye MET i deen)

U.S. Brand NamesTagamet® HB 200 [OTC]

Canadian Brand NamesApo-Cimetidine®; Gen-Cimetidine; Novo-Cimetidine; Nu-Cimet; PMS-Cimetidine; Tagamet® HB

Pharmacologic CategoryHistamine H_2 Antagonist

Use: Labeled IndicationsShort-term treatment of active duodenal ulcers and benign gastric ulcers; long-term prophylaxis of duodenal ulcer; gastric hypersecretory states; gastroesophageal reflux; prevention of upper GI bleeding in critically-ill patients; labeled for OTC use for prevention or relief of heartburn, acid indigestion, or sour stomach

Use: Unlabeled/InvestigationalPart of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence

Dosing: Adults

Short-term treatment of active ulcers:

Oral: 300 mg 4 times/day or 800 mg at bedtime or 400 mg twice daily for up to 8 weeks

Note: Higher doses of 1600 mg at bedtime for 4 weeks may be beneficial for a subpopulation of patients with larger duodenal ulcers (>1 cm defined endoscopically) who are also heavy smokers (≥1 pack/day).

I.M., I.V.: 300 mg every 6 hours or 37.5 mg/hour by continuous infusion; I.V. dosage should be adjusted to maintain an intragastric pH ≥5

Prevention of upper GI bleed in critically-ill patients: 50 mg/hour by continuous infusion; I.V. dosage should be adjusted to maintain an intragastric pH ≥5

Note: Reduce dose by 50% if Cl_{cr} <30 mL/minute; treatment >7 days has not been evaluated.

Duodenal ulcer prophylaxis: Oral: 400 mg at bedtime

Gastric hypersecretory conditions: Oral, I.M., I.V.: 300-600 mg every 6 hours; dosage not to exceed 2.4 g/day

Gastroesophageal reflux disease: Oral: 400 mg 4 times/day or 800 mg twice daily for 12 weeks

Peptic ulcer disease eradication of*Helicobacter pylori*(unlabeled use): Oral: 400 mg twice daily; requires combination therapy with antibiotics

Heartburn, acid indigestion, sour stomach (OTC labeling): Oral: 200 mg up to twice daily; may take 30 minutes prior to eating foods or beverages expected to cause heartburn or indigestion

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Oral, I.M., I.V.: 20-40 mg/kg/day in divided doses every 6 hours

Heartburn, acid indigestion, sour stomach (OTC labeling): Children ≥12 years: Oral: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 50% of normal dose

Cl_{cr} <10 mL/minute: Administer 25% of normal dose

Slightly dialyzable (5% to 20%); administer after dialysis

Dosing: Hepatic ImpairmentUsual dose is safe in mild liver disease but use with caution and in reduced dosage in severe liver disease. Increased risk of CNS toxicity in cirrhosis suggested by enhanced penetration of CNS.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.May be administered as a slow I.V. push or preferably as an I.V. intermittent or I.V. continuous infusion. Administer each 300 mg (or fraction thereof) over a minimum of 5 minutes when giving I.V. push. Rapid intravenous administration has been associated with rare cases of arrhythmia and/or hypotension. Give intermittent infusion over 15-30 minutes for each 300 mg dose. Intermittent infusions are administered over 15-30 minutes at a final concentration not to exceed 6 mg/mL; for patients with an active bleed, preferred method of administration is continuous infusion.

Administration: I.V. DetailRapid infusion may cause cardiac arrhythmias and hypotension.

pH: 3.8-6.0 (injection); 5-7 (premixed infusion)

Administration: OralGive with meals so that the drug's peak effect occurs at the proper time (peak inhibition of gastric acid secretion occurs at 1 and 3 hours after dosing in fasting subjects and approximately 2 hours in nonfasting subjects. This correlates well with the time food is no longer in the stomach offering a buffering effect). Stagger doses of antacids with cimetidine.

Storage

Tablet: Store between 15°C and 30°C (59°F to 86°F); protect from light.

Solution for injection/infusion: Intact vials should be stored at room temperature, between 15°C and 30°C (59°F to 86°F); protect from light. May precipitate from solution upon exposure to cold, but can be redissolved by warming without degradation.

Stability at room temperature:

Prepared bags: 7 days

Premixed bags: Manufacturer expiration dating and out of overwrap stability: 15 days

Stable in parenteral nutrition solutions for up to 7 days when protected from light.

CompatibilityStable in D_5LR, $D_5\,^1/_4$NS, $D_5\,^1/_2$NS, D_5NS, D_5W, D_{10}W, D_{10}NS, LR, sodium bicarbonate 5%, NS; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Acyclovir, amifostine, aminophylline, atracurium, aztreonam, cisatracurium, cisplatin, cladribine, clarithromycin, cyclophosphamide, cytarabine, diltiazem, docetaxel, doxorubicin, doxorubicin liposome, enalaprilat, esmolol, etoposide, filgrastim, fluconazole, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, haloperidol, heparin, hetastarch, idarubicin, inamrinone, labetalol, levofloxacin, linezolid, melphalan, meropenem, methotrexate, midazolam, milrinone, ondansetron, paclitaxel, pancuronium, piperacillin/tazobactam, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, topotecan, vecuronium, vinorelbine, zidovudine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, amsacrine, cefepime, indomethacin, warfarin. **Variable (consult detailed reference):** TPN.

Compatibility in syringe: Compatible: Atropine, butorphanol, diatrizoate meglumine and diatrizoate sodium, diatrizoate sodium, diazepam, diphenhydramine, doxapram, droperidol, fentanyl, glycopyrrolate, heparin, hydromorphone, hydroxyzine, iohexol, iopamidol, iothalamate meglumine, lorazepam, meperidine, midazolam, morphine, nafcillin, nalbuphine, penicillin G sodium, pentazocine, perphenazine, prochlorperazine edisylate, promazine, promethazine, scopolamine, sodium acetate, sodium chloride, sodium lactate. **Incompatible:** Atropine with pentobarbital, cefamandole, cefazolin, chlorpromazine, ioxaglate meglumine and ioxaglate sodium, pentobarbital, secobarbital.

Compatibility when admixed: Compatible: Acetazolamide, amikacin, aminophylline, ampicillin, atracurium, cefoperazone, cefoxitin, ceftazidime, chlorothiazide, clindamycin, colistimethate, cryptenamine, dexamethasone sodium phosphate, digoxin, epinephrine, erythromycin lactobionate, ethacrynate sodium, floxacillin, flumazenil, furosemide, gentamicin, insulin (regular), isoproterenol, lidocaine, lincomycin, meropenem, metaraminol, methylprednisolone sodium succinate, metoclopramide, norepinephrine, penicillin G potassium, phytonadione, polymyxin B sulfate, potassium chloride, protamine, quinidine gluconate, sodium nitroprusside, tacrolimus, vancomycin, verapamil, vitamin B complex, vitamin B complex with C. **Incompatible:** Amphotericin B, barbiturates. **Variable (consult detailed reference):** Cefamandole, cefazolin.

ContraindicationsHypersensitivity to cimetidine, any component of the formulation, or other H_2 antagonists

Allergy Considerations

- Histamine H_2 Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Confusion: Reversible confusional states, usually clearing within 3-4 days after discontinuation, have been linked to use. Increased age (>50 years) and renal or hepatic impairment are thought to be associated.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Concurrent drug therapy issues:

- Drugs metabolized through P450 system: Dosage should be adjusted in patients receiving drugs metabolized through the P450 system.

Other warnings/precautions:

- I.V. administration: Rapid intravenous administration has been associated with rare cases of arrhythmia and/or hypotension.
- OTC labeling: Should not be taken by individuals experiencing painful swallowing, vomiting with blood, or bloody or black stools; medical attention should be sought. A healthcare provider should be consulted prior to use when pain in the stomach, shoulder, arms or neck is present; if heartburn has occurred for >3 months; or if unexplained weight loss, or nausea and vomiting occur.

Frequent wheezing, shortness of breath, lightheadedness, or sweating, especially with chest pain or heartburn, should also be reported. Consultation of a healthcare provider should occur by patients if also taking theophylline, phenytoin, or warfarin; if heartburn or stomach pain continues or worsens; or if use is required for >14 days. OTC cimetidine is not approved for use in patients <12 years of age.

Geriatric ConsiderationsPatients diagnosed with PUD should be evaluated for *Helicobacter pylori*. H_2 blockers are the preferred drugs for treating PUD in elderly due to cost and ease of administration. These agents are no less or more effective than any other therapy. The preferred agents, due to favorable pharmacokinetic, side effect and drug interaction profiles are ranitidine, famotidine, and nizatidine. Due to the potential for confusion and drug interactions, cimetidine has been identified by a panel of experts as a drug to avoid in the elderly. Consider evaluating creatinine clearance before initiating H_2-blocker therapy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic events were not observed in animal studies.

LactationEnters breast milk/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Headache (2% to 4%), dizziness (1%), somnolence (1%), agitation

Endocrine & metabolic: Gynecomastia (<1% to 4%)

Gastrointestinal: Diarrhea (1%)

Frequency not defined:

Cardiovascular: AV block, bradycardia, hypotension, tachycardia, vasculitis

Central nervous system: Confusion, fever

Dermatologic: Alopecia, erythema multiforme, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, rash

Endocrine & metabolic: Edema of the breasts, sexual ability decreased

Gastrointestinal: Nausea, pancreatitis, vomiting

Hematologic: Agranulocytosis, aplastic anemia, hemolytic anemia (immune-based), neutropenia, pancytopenia, thrombocytopenia

Hepatic: ALT increased, AST increased, hepatic fibrosis (case report)

Neuromuscular & skeletal: Arthralgia, myalgia, polymyositis

Renal: Creatinine increased, interstitial nephritis

Miscellaneous: Anaphylaxis, pneumonia (causal relationship not established)

Metabolism/Transport Effects**Inhibits** CYP1A2 (moderate), 2C9 (weak), 2C19 (moderate), 2D6 (moderate), 2E1 (weak), 3A4 (moderate)

Drug Interactions

Alfentanil: Cimetidine may decrease the metabolism of Alfentanil. *Risk C: Monitor therapy*

Amiodarone: Cimetidine may decrease the metabolism of Amiodarone. Consider using an alternative H_2 antagonist. *Risk D: Consider therapy modification*

Anticonvulsants (Hydantoin): Cimetidine may decrease the metabolism of Anticonvulsants (Hydantoin). **Exceptions:** Ethotoin. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): H2-Antagonists may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole; Voriconazole. *Risk D: Consider therapy modification*

Atazanavir: H2-Antagonists may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Cimetidine may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers: Cimetidine may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** AmLODIPine; Clevidipine; NiCARdipine. *Risk D: Consider therapy modification*

CarBAMazepine: Cimetidine may increase the serum concentration of CarBAMazepine. The serum carbamazepine concentration might return to normal within one week of starting cimetidine. *Risk C: Monitor therapy*

Carmustine: Cimetidine may decrease the metabolism of Carmustine. *Risk C: Monitor therapy*

Carvedilol: Cimetidine may decrease the metabolism of Carvedilol. *Risk C: Monitor therapy*

Cefpodoxime: H2-Antagonists may decrease the absorption of Cefpodoxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Cefuroxime: H2-Antagonists may decrease the absorption of Cefuroxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Cisapride: Cimetidine may decrease the metabolism of Cisapride. *Risk D: Consider therapy modification*

Clozapine: Cimetidine may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: H2-Antagonists may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Dofetilide: Cimetidine may decrease the excretion of Dofetilide. Cimetidine may decrease the metabolism of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Erlotinib: H2-Antagonists may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fosamprenavir: H2-Antagonists may decrease the serum concentration of Fosamprenavir. Cimetidine may also inhibit the metabolism of the active metabolite amprenavir, making its effects on fosamprenavir/amprenavir concentrations difficult to predict. *Risk C: Monitor therapy*

Iron Salts: H2-Antagonists may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

MetFORMIN: Cimetidine may decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Moclobemide: Cimetidine may decrease the metabolism of Moclobemide. *Risk D: Consider therapy modification*

Moricizine: Cimetidine may decrease the metabolism of Moricizine. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nicotine: Cimetidine may decrease the metabolism of Nicotine. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Praziquantel: Cimetidine may decrease the metabolism of Praziquantel. *Risk C: Monitor therapy*

Procainamide: Cimetidine may decrease the excretion of Procainamide. *Risk D: Consider therapy modification*

Propafenone: Cimetidine may increase the serum concentration of Propafenone. *Risk D: Consider therapy modification*

QuiNIDine: Cimetidine may decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Saquinavir: H2-Antagonists may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Cimetidine may decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Sulfonylureas: Cimetidine may decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Theophylline Derivatives: Cimetidine may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Cimetidine may decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Cimetidine may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Zaleplon: Cimetidine may decrease the metabolism of Zaleplon. *Risk D: Consider therapy modification*

Zolmitriptan: Cimetidine may increase the serum concentration of Zolmitriptan. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Cimetidine may increase serum caffeine levels if taken with caffeine. Cimetidine peak serum levels may be decreased if taken with food.

Herb/Nutraceutical: St John's wort may decrease cimetidine levels.

Monitoring ParametersCBC, gastric pH, occult blood with GI bleeding; monitor renal function to correct dose.

Nursing: Physical Assessment/MonitoringUse caution in presence of renal or hepatic impairment. Assess other pharmacological or herbal products patient may be taking for potential interactions. **I.V.:** Note administration specifics. Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse effects (eg, changes in CNS, agitation; gastric bleeding) regularly during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, gastric pH, occult blood with GI bleeding; monitor renal function to correct dose.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take with meals. Do not increase dose or frequency without consulting prescriber. To be effective, continue to take for the prescribed time (possibly several weeks) even though symptoms may have improved. Smoking decreases the effectiveness of cimetidine (stop smoking if possible). Avoid excess alcohol and caffeine. May cause headache, dizziness, agitation (use caution when driving or engaging in any potentially hazardous tasks until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report chest pain or palpitations; CNS changes (confusion, agitation); persistent diarrhea, nausea, vomiting, or heartburn; black tarry stools or coffee ground-like emesis; rash; unusual bleeding or bruising; sore throat; or fever; unexplained weight lose or other adverse effects.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength is expressed as base

Infusion [premixed in NS]: 300 mg (50 mL)

Injection, solution: 150 mg/mL (2 mL, 8 mL)

Solution, oral: 300 mg/5 mL (240 mL, 480 mL)

Tablet: 200 mg [OTC], 300 mg, 400 mg, 800 mg

Tagamet® HB 200: 200 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Cimetidine HCl)

300 mg/5 mL (237): $35.55

Tablets (Cimetidine)

200 mg (30): $19.99

300 mg (180): $29.00

400 mg (90): $25.49

800 mg (30): $17.99

Tablets (Tagamet)

300 mg (60): $71.80

400 mg (60): $114.89

Mechanism of ActionCompetitive inhibition of histamine at H_2 receptors of the gastric parietal cells resulting in reduced gastric acid secretion, gastric volume and hydrogen ion concentration reduced

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Duration: 4-8 hours

Absorption: Rapid

Distribution: Crosses placenta; enters breast milk

Protein binding: 20%

Metabolism: Partially hepatic, forms metabolites

Bioavailability: 60% to 70%

Half-life elimination: Neonates: 3.6 hours; Children: 1.4 hours; Adults: Normal renal function: 2 hours

Time to peak, serum: Oral: 1-2 hours

Excretion: Primarily urine (48% as unchanged drug); feces (some)

Related Information

- Antacid Drug Interactions
- Depression

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause agitation or drowsiness; rare reports of confusion

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis; use caution with clozapine and carbamazepine; may inhibit the metabolism of TCAs and benzodiazepines; monitor for adverse effects

Cardiovascular ConsiderationsCimetidine has extensive drug interactions, particularly with antiarrhythmics (lidocaine, phenytoin, procainamide, quinidine) and may also increase the likelihood of theophylline and cyclosporine toxicity. Because of inhibition of warfarin metabolism, cimetidine may increase INR in patients on anticoagulation therapy.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2008 Surviving Sepsis Campaign guidelines recommend that stress ulcer prophylaxis using an H_2 blocker (Grade 1A) or proton pump inhibitor (Grade 1B) be given to patients with severe sepsis to prevent upper GI bleed. Benefit of prevention of upper GI bleed must be weighed against potential effect of increased stomach pH on development of ventilator-associated pneumonia.

Cinacalcet

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sin a KAL cet)

U.S. Brand NamesSensipar®

Canadian Brand NamesSensipar®

Pharmacologic CategoryCalcimimetic

Use: Labeled IndicationsTreatment of secondary hyperparathyroidism in patients with chronic kidney disease (CKD) on dialysis; treatment of hypercalcemia in patients with parathyroid carcinoma

Note: In Canada, cinacalcet is approved only for the treatment of secondary hyperparathyroidism in patients with chronic kidney disease (CKD) on dialysis

Use: Unlabeled/InvestigationalPrimary hyperparathyroidism

Dosing: Adults**Note:** Do not titrate dose more frequently than every 2-4 weeks.

Secondary hyperparathyroidism: Oral: Initial: 30 mg once daily (maximum daily dose: 180 mg); increase dose incrementally (60 mg, 90 mg, 120 mg, 180 mg once daily) as necessary to maintain iPTH level between 150-300 pg/mL.

Parathyroid carcinoma: Oral: Initial: 30 mg twice daily (maximum daily dose: 360 mg daily as 90 mg 4 times/day); increase dose incrementally (60 mg twice daily, 90 mg twice daily, 90 mg 3-4 times/day) as necessary to normalize serum calcium levels.

Dosing: ElderlyRefer to adult dosing. No adjustment required.

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic ImpairmentPatients with moderate-to-severe dysfunction (Child-Pugh classes B and C) have an increased exposure to cinacalcet and increased half-life.

Dosing: Adjustment for Toxicity**Dosage adjustment for hypocalcemia:**

If serum calcium >7.5 mg/dL but <8.4 mg/dL **or** if hypocalcemia symptoms occur: Use calcium-containing phosphate binders and/or vitamin D to raise calcium levels.

If serum calcium <7.5 mg/dL **or** if hypocalcemia symptoms persist and the dose of vitamin D cannot be increased: Withhold cinacalcet until serum calcium ≥8 mg/dL and/or symptoms of hypocalcemia resolve. Reinitiate cinacalcet at the next lowest dose.

If iPTH <150-300 pg/mL: Reduce dose or discontinue cinacalcet and/or vitamin D.

Calculations

- Calcium Correction

Administration: OralAdminister with food or shortly after a meal. Do not break tablet; should be taken whole.

Dietary ConsiderationsTake with food or shortly after a meal. May be taken with vitamin D and/or phosphate binders.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to cinacalcet or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Adynamic bone disease: May develop if iPTH levels are suppressed (<100 pg/mL); reduce dose or discontinue use of cinacalcet and/or vitamin D if iPTH levels decrease below 150-300 pg/mL (NKF-K/DOQI guidelines).
- Hypocalcemia: If hypocalcemia develops or symptoms of hypocalcemia (eg, cramps, myalgia, paresthesia, seizure, tetany) occur during treatment, consider initiating supplemental calcium, calcium-based phosphate binder, or vitamin D or temporarily withholding cinacalcet. Serum calcium levels should be ≥8.4 mg/dL prior to initiating treatment. Dosage reductions may be necessary upon reinitiation of cinacalcet treatment.
- Testosterone level reductions: Cinacalcet may cause a decrease in testosterone levels (free and total). Although below normal testosterone levels may occur in patients with end-stage renal disease, the clinical significance has not been determined.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; idiosyncratic hypotension and/or worsening of heart failure have been reported in patients with impaired cardiovascular function.
- Hepatic impairment: Use with caution in patients with moderate-to-severe hepatic impairment (Child-Pugh classes B & C); cinacalcet exposure and half-life are increased; monitor closely.
- Renal impairment: In the U.S., the long-term safety and efficacy of cinacalcet has not been evaluated in chronic kidney disease (CKD) patients with hyperparathyroidism not requiring dialysis. Not indicated for CKD patients not receiving dialysis. Although possibly related to lower baseline calcium levels, clinical studies have shown an increased incidence of hypocalcemia (<8.4 mg/dL) in patients not requiring dialysis.

- Seizure disorder: Use with caution in patients with a history of seizure disorder; seizure threshold is lowered by significant serum calcium reductions. Monitor calcium levels closely.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIn animal studies, there were no teratogenic effects seen. There are no adequate or well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse effects in the nursing infant, the manufacturer recommends discontinuing nursing or discontinuing cinacalcet.

Adverse Reactions

>10%:

Endocrine & metabolic: Hypocalcemia

Gastrointestinal: Nausea (31%), vomiting (27%), diarrhea (21%)

Neuromuscular & skeletal: Myalgia (15%)

1% to 10%:

Cardiovascular: Hypertension (7%)

Central nervous system: Dizziness (10%), seizure (1%)

Endocrine & metabolic: Testosterone decreased

Gastrointestinal: Anorexia (6%)

Neuromuscular & skeletal: Weakness (7%), chest pain (noncardiac; 6%)

Postmarketing and/or case reports: Adynamic bone disease, heart failure (worsening; in patients with cardiac dysfunction), hypersensitivity reactions, hypotension (idiosyncratic; in patients with cardiac dysfunction), rash

Metabolism/Transport Effects**Substrate** of CYP1A2, 2D6, 3A4; **Inhibits** CYP2D6 (major)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Cinacalcet. **Exceptions:** Itraconazole. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Tacrolimus: Cinacalcet may decrease the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Cinacalcet may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food increases bioavailability.

Monitoring Parameters

Hyperparathyroidism: Serum calcium and phosphorus levels prior to initiation and within a week of initiation or dosage adjustment; iPTH should be measured 1-4 weeks after initiation or dosage adjustment. After the maintenance dose is established, monthly calcium and phosphorus levels and iPTH every 1-3 months are required. Wait at least 12 hours after dose before drawing PTH levels.

Parathyroid carcinoma: Serum calcium levels prior to initiation and within a week of initiation or dosage adjustment; once maintenance dose is established, obtain serum calcium level every 2 months.

Reference Range

CKD K/DOQI guidelines definition of stages; chronic disease is kidney damage or GFR <60 mL/minute/1.73 m^2 for ≥3 months:

Stage 2: GFR 60-89 mL/minute/1.73 m^2 (kidney damage with mild decrease GFR)

Stage 3: GFR 30-59 mL/minute/1.73 m^2 (moderate decrease GFR)

Stage 4: GFR 15-29 mL/minute/1.73 m^2 (severe decrease GFR)

Stage 5: GFR <15 mL/minute/1.73 m^2 or dialysis (kidney failure)

Target range for iPTH: Adults:

Stage 3 CKD: 35-70 pg/mL

Stage 4 CKD: 70-110 pg/mL

Stage 5 CKD: 150-300 pg/mL

Serum phosphorus: Adults:

Stage 3 and 4 CKD: ≥2.7 to <4.6 mg/dL

Stage 5 CKD: 3.5-5.5 mg/dL

Serum calcium-phosphorus product: Adults: Stage 3-5 CKD: <55 mg^2/dL^2

Nursing: Physical Assessment/MonitoringUse caution with history of seizure disorder; assess serum calcium levels closely prior to initiating therapy or dose change and regularly during maintenance therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions. Assess results of laboratory tests, therapeutic response (calcium levels), and adverse reactions (eg, hypocalcemia [paresthesias, myalgia, cramping, tetany, convulsions]) frequently at beginning of therapy and regularly thereafter. Teach patient possible side effects, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab Tests

Hyperparathyroidism: Serum calcium and phosphorus levels prior to initiation and within a week of initiation or dosage adjustment; iPTH should be measured 1-4 weeks after initiation or dosage adjustment. After the maintenance dose is established, monthly calcium and phosphorus levels and iPTH every 1-3 months are required. Wait at least 12 hours after dose before drawing PTH levels.

Parathyroid carcinoma: Serum calcium levels prior to initiation and within a week of initiation or dosage adjustment; once maintenance dose is established, obtain serum calcium level every 2 months.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed with food; do not break, chew, or crush tablet (swallow whole). Do not take more than prescribed. You may experience dizziness (use caution when driving or engaged in potentially hazards tasks until response to drug is known); nausea, vomiting, or loss of appetite (good mouth care, small frequent meals, sucking lozenges, or chewing gum may help); diarrhea (yogurt or boiled milk may help). Report any muscle cramping, twitches, tremors, or spasms; chest pain or palpitations; unresolved gastrointestinal disturbance, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Sensipar®: 30 mg, 60 mg, 90 mg

Generic AvailableNo

ManufacturerAmgen

Pricing: U.S. (www.drugstore.com)

Tablets (Sensipar)

30 mg (30): $374.09

60 mg (30): $754.55

90 mg (30): $1038.51

Mechanism of ActionIncreases the sensitivity of the calcium-sensing receptor on the parathyroid gland thereby, concomitantly lowering PTH and serum calcium levels.

Pharmacodynamics/Kinetics

Distribution: V_d: ~1000 L

Protein binding: ~93% to 97%

Metabolism: Hepatic (extensive) via CYP3A4, 2D6, 1A2; forms inactive metabolites

Half-life elimination: Terminal: 30-40 hours; moderate hepatic impairment: prolonged 33%; severe hepatic impairment: prolonged 70%

Time to peak, plasma: Nadir in iPTH levels: 2-6 hours postdose

Excretion: Urine 80% (as metabolites); feces 15%

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness is common
Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; these effects may be additive with concurrent use of SSRIs, lithium, or valproate. Cinacalcet may increase levels of amitriptyline and nortriptyline; monitor for increased effects and/or serum levels.
Index TermsAMG 073; Cinacalcet Hydrochloride

U.S. Brand NamesCiprodex®

Canadian Brand NamesCiprodex®

Pharmacologic CategoryAntibiotic/Corticosteroid, Otic

Use: Labeled IndicationsTreatment of acute otitis media in pediatric patients with tympanostomy tubes or acute otitis externa in children and adults

Dosing: AdultsAcute otitis externa: Otic: Instill 4 drops into affected ear(s) twice daily for 7 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAcute otitis media in patients with tympanostomy tubes or acute otitis externa: Otic: Instill 4 drops into affected ear(s) twice daily for 7 days

Administration: OtherOtic: Prior to instillation, bottle should be warmed in hands for 1-2 minutes. Shake suspension well immediately before using. Patient should lie with affected ear upward and remain in this position for 60 seconds following application. Drops should be instilled directly into tympanostomy tube (if present) and tragus should be pumped 5 times to facilitate penetration into the middle ear.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light.

ContraindicationsHypersensitivity to ciprofloxacin, other quinolones, dexamethasone, or any component of the formulation; not for use in viral infection of the external canal

Allergy Considerations

- Corticosteroid Allergy
- Fluoroquinolone Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Special populations:

- Pediatrics: Safety and efficacy have been established in children ≥6 months of age, however, the manufacturer states that there are no safety concerns which would preclude the use of this product in younger children.

Other warnings/precautions:

- Appropriate use: For otic use only; not intended for injection or ophthalmic use. Prior to instillation, suspension should be warmed in hands to prevent dizziness which may occur following use of a cold solution.

Pregnancy Risk FactorC

Pregnancy ConsiderationsRefer to individual agents. Reproduction studies have not been conducted with the otic preparation. Ciprofloxacin is detectable in the serum following otic administration.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if serum levels of ciprofloxacin or dexamethasone are high enough following otic administration to produce detectable quantities in breast milk.

Adverse Reactions

1% to 10%: Otic: Discomfort (3%), pain (<1% to 2%), pruritus (1%)

<1%: Hearing decreased, ear congestion, ear erythema, ear residue, ear tingling, irritability, taste perversion

Metabolism/Transport Effects

Ciprofloxacin: **Inhibits** CYP1A2 (strong), 3A4 (weak)

Dexamethasone: **Substrate** of CYP3A4 (minor); **Induces** CYP2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium

Bicarbonate. *Risk D: Consider therapy modification*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Caffeine: Quinolone Antibiotics may decrease the metabolism of Caffeine. *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Lenalidomide: Dexamethasone may enhance the thrombogenic effect of Lenalidomide. *Risk D: Consider therapy modification*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market];

Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Ciprofloxacin may increase the serum concentration of Methotrexate. *Risk C: Monitor therapy*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pentoxifylline: Ciprofloxacin may enhance the adverse/toxic effect of Pentoxifylline. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Ciprofloxacin may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

QTc-Prolonging Agents: Ciprofloxacin may enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Ropinirole: Ciprofloxacin may decrease the metabolism of Ropinirole. *Risk C: Monitor therapy*

Ropivacaine: Ciprofloxacin may decrease the metabolism of Ropivacaine. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hyperglycemic effect of Sulfonylureas. Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Thalidomide: Dexamethasone may enhance the dermatologic adverse effect of Thalidomide. Dexamethasone may enhance the thrombogenic effect of Thalidomide. *Risk D: Consider therapy modification*

Theophylline Derivatives: Quinolone Antibiotics may decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

TiZANidine: Ciprofloxacin may decrease the metabolism of TiZANidine. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, otic: Ciprofloxacin 0.3% and dexamethasone 0.1% (7.5 mL) [contains benzalkonium chloride]

Generic AvailableNo
ManufacturerAlcon, Inc
Pricing: U.S. (www.drugstore.com)

Suspension (Ciprodex)

0.3-0.1% (7.5): $102.06

Mechanism of ActionCiprofloxacin is a quinolone antibiotic; dexamethasone is a corticosteroid used to decrease inflammation accompanying bacterial infections
Pharmacodynamics/Kinetics

Absorption: Otic: Ciprofloxacin: Minor systemic absorption

Time to peak, plasma: Otic: Ciprofloxacin: 15 minutes to 2 hours

Related Information

Pharmacologic CategoryAntibiotic/Corticosteroid, Otic

Use: Labeled IndicationsTreatment of acute otitis externa, sometimes known as “swimmer's ear”

Dosing: AdultsOtitis externa: Otic: The recommended dosage for all patients is three drops of the suspension in the affected ear twice daily for 7 days; twice-daily dosing schedule is more convenient for patients than that of existing treatments with hydrocortisone, which are typically administered three or four times a day; a twice-daily dosage schedule may be especially helpful for parents and caregivers of young children

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥1 year: Refer to adult dosing.

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Ciprofloxacin may increase the serum concentration of Methotrexate. *Risk C: Monitor therapy*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pentoxifylline: Ciprofloxacin may enhance the adverse/toxic effect of Pentoxifylline. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Ciprofloxacin may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

QTc-Prolonging Agents: Ciprofloxacin may enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Ropinirole: Ciprofloxacin may decrease the metabolism of Ropinirole. *Risk C: Monitor therapy*

Ropivacaine: Ciprofloxacin may decrease the metabolism of Ropivacaine. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider*

therapy modification

Sulfonylureas: Quinolone Antibiotics may enhance the hyperglycemic effect of Sulfonylureas. Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Theophylline Derivatives: Quinolone Antibiotics may decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

TiZANidine: Ciprofloxacin may decrease the metabolism of TiZANidine. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, otic: Ciprofloxacin hydrochloride 0.2% and hydrocortisone 1% (10 mL) [contains benzyl alcohol]

Generic AvailableNo
ManufacturerBayer Corp (Biological and Pharmaceutical Division)
Pricing: U.S. (www.drugstore.com)

Suspension (Cipro HC)

0.2-1% (10): $99.99

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Ciprofloxacin
- Hydrocortisone

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsCiprofloxacin Hydrochloride and Hydrocortisone; Hydrocortisone and Ciprofloxacin
International Brand NamesCiflox (DK); Cipro HC (BR); Cipro HC Otic (HK); Cipro HC Otico (AR); Ciprobay HC (EE, KP, SG, ZA); Ciproxin HC (CH); Ciproxin HC ear drops (AU); Ciproxin HC Otic Drops (NZ); Ciriax Otic (PE); Oto Eni (MX); Otosec HC (CO)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ciprofloxacin may be confused with cephalexin

Ciloxan® may be confused with cinoxacin, Cytoxan®

Cipro® may be confused with Ceftin®

Pronunciation(sip roe FLOKS a sin)

U.S. Brand NamesCiloxan®; Cipro®; Cipro® XR; Proquin® XR

Canadian Brand NamesApo-Ciproflox®; Ciloxan®; Cipro®; Cipro® XL; CO Ciprofloxacin; Dom-Ciprofloxacin; Gen-Ciprofloxacin; Novo-Ciprofloxacin; PHL-Ciprofloxacin; PMS-Ciprofloxacin; RAN™-Ciprofloxacin; ratio-Ciprofloxacin; Riva-Ciprofloxacin; Sandoz-Ciprofloxacin; Taro-Ciprofloxacin

Pharmacologic CategoryAntibiotic, Ophthalmic; Antibiotic, Quinolone

Use: Labeled Indications

Children: Complicated urinary tract infections and pyelonephritis due to *E. coli*. **Note:** Although effective, ciprofloxacin is not the drug of first choice in children.

Children and Adults: To reduce incidence or progression of disease following exposure to aerolized *Bacillus anthracis*. Ophthalmologically, for superficial ocular infections (corneal ulcers, conjunctivitis) due to susceptible strains

Adults: Treatment of the following infections when caused by susceptible bacteria: Urinary tract infections; acute uncomplicated cystitis in females; chronic bacterial prostatitis; lower respiratory tract infections (including acute exacerbations of chronic bronchitis); acute sinusitis; skin and skin structure infections; bone and joint infections; complicated intra-abdominal infections (in combination with metronidazole); infectious diarrhea; typhoid fever due to *Salmonella typhi* (eradication of chronic typhoid carrier state has not been proven); uncomplicated cervical and urethra gonorrhea (due to *N. gonorrhoeae*); nosocomial pneumonia; empirical therapy for febrile neutropenic patients (in combination with piperacillin)

Note: As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of gonococcal disease.

Use: Unlabeled/InvestigationalAcute pulmonary exacerbations in cystic fibrosis (children); cutaneous/gastrointestinal/oropharyngeal anthrax (treatment, children and adults); disseminated gonococcal infection (adults); chancroid (adults); prophylaxis to *Neisseria meningitidis* following close contact with an infected person; empirical therapy (oral) for febrile neutropenia in low-risk cancer patients; HACEK group endocarditis; infectious diarrhea (children)

Use: DentalUseful as a single agent or in combination with metronidazole in the treatment of periodontitis associated with the presence of *Actinobacillus actinomycetemcomitans* (AA), as well as enteric rods/pseudomonads

Dosing: Adults**Note:** Extended release tablets and immediate release formulations are not interchangeable. Unless otherwise specified, oral dosing reflects the use of immediate release formulations.

Anthrax:

Inhalational (postexposure prophylaxis):

Oral: 500 mg every 12 hours for 60 days

I.V.: 400 mg every 12 hours for 60 days

Cutaneous (treatment, CDC guidelines): Oral: Immediate release formulation: 500 mg every 12 hours for 60 days. **Note:** In the presence of systemic involvement, extensive edema, lesions on head/neck, refer to I.V. dosing for treatment of inhalational/gastrointestinal/oropharyngeal anthrax.

Inhalational/gastrointestinal/oropharyngeal (treatment, CDC guidelines): I.V.: 400 mg every 12 hours. **Note:** Initial treatment should include two or more agents predicted to be effective (per CDC recommendations). Continue combined therapy for 60 days.

Bacterial conjunctivitis:

Ophthalmic solution: Instill 1-2 drops in eye(s) every 2 hours while awake for 2 days and 1-2 drops every 4 hours while awake for the next 5 days

Ophthalmic ointment: Apply a $^{1}/_{2}$" ribbon into the conjunctival sac 3 times/day for the first 2 days, followed by a $^{1}/_{2}$" ribbon applied twice daily for the next 5 days

Bone/joint infections:

Oral: 500-750 mg twice daily for 4-6 weeks

I.V.:

Mild/moderate: 400 mg every 12 hours for 4-6 weeks

Severe/complicated: 400 mg every 8 hours for 4-6 weeks

Chancroid (CDC guidelines): Oral: 500 mg twice daily for 3 days

Corneal ulcer: Ophthalmic solution: Instill 2 drops into affected eye every 15 minutes for the first 6 hours, then 2 drops into the affected eye every 30 minutes for the remainder of the first day. On day 2, instill 2 drops into the affected eye hourly. On days 3-14, instill 2 drops into affected eye every 4 hours. Treatment may continue after day 14 if re-epithelialization has not occurred.

Endocarditis due to HACEK organisms (AHA guidelines, unlabeled use):Note: Not first-line option; use only if intolerant of beta-lactam therapy:

Oral: 500 mg every 12 hours for 4 weeks

I.V.: 400 mg every 12 hours for 4 weeks

Febrile neutropenia*: I.V.: 400 mg every 8 hours for 7-14 days

Gonococcal infections:

Urethral/cervical gonococcal infections: Oral: 250-500 mg as a single dose (CDC recommends concomitant doxycycline or azithromycin due to possible coinfection with *Chlamydia*; **Note:** As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of uncomplicated gonococcal disease.

Disseminated gonococcal infection (CDC guidelines): Oral: 500 mg twice daily to complete 7 days of therapy (initial treatment with ceftriaxone 1 g I.M./I.V. daily for 24-48 hours after improvement begins); **Note:** As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of more serious gonococcal disease, unless no other options exist and susceptibility can be confirmed via culture.

Infectious diarrhea: Oral:

Salmonella: 500 mg twice daily for 5-7 days

Shigella: 500 mg twice daily for 3 days

Traveler's diarrhea: Mild: 750 mg for one dose; Severe: 500 mg twice daily for 3 days

Vibrio cholerae: 1 g for one dose

Intra-abdominal*:

Oral: 500 mg every 12 hours for 7-14 days

I.V.: 400 mg every 12 hours for 7-14 days

Lower respiratory tract, skin/skin structure infections:

Oral: 500-750 mg twice daily for 7-14 days

I.V.:

Mild/moderate: 400 mg every 12 hours for 7-14 days

Severe/complicated: 400 mg every 8 hours for 7-14 days

Nosocomial pneumonia: I.V.: 400 mg every 8 hours for 10-14 days

Prostatitis (chronic, bacterial): Oral: 500 mg every 12 hours for 28 days

Sinusitis (acute): Oral: 500 mg every 12 hours for 10 days

Typhoid fever: Oral: 500 mg every 12 hours for 10 days

Urinary tract infection:

Acute uncomplicated, cystitis:

Oral:

Immediate release formulation: 250 mg every 12 hours for 3 days

Extended release formulation (Cipro® XR, Proquin® XR): 500 mg every 24 hours for 3 days

I.V.: 200 mg every 12 hours for 7-14 days

Complicated (including pyelonephritis):

Oral:

Immediate release formulation: 500 mg every 12 hours for 7-14 days

Extended release formulation (Cipro® XR): 1000 mg every 24 hours for 7-14 days

I.V.: 400 mg every 12 hours for 7-14 days

*Combination therapy generally recommended.

Dosing: ElderlyRefer to adult dosing. Adjust dose carefully based on renal function.

Dosing: PediatricSee Warnings/Precautions. **Note:** Extended release tablets and immediate release formulations are not interchangeable. Unless otherwise specified, oral dosing reflects the use of immediate release formulations.

Anthrax:

Inhalational (postexposure prophylaxis):

Oral: 15 mg/kg/dose every 12 hours for 60 days; maximum: 500 mg/dose

I.V.: 10 mg/kg/dose every 12 hours for 60 days; do **not** exceed 400 mg/dose (800 mg/day)

Cutaneous (treatment, CDC guidelines): Oral: 10-15 mg/kg every 12 hours for 60 days (maximum: 1 g/day); amoxicillin 80 mg/kg/day divided every 8 hours is an option for completion of treatment after clinical improvement. **Note:** In the presence of systemic involvement, extensive edema, lesions on head/neck, refer to I.V. dosing for treatment of inhalational/gastrointestinal/oropharyngeal anthrax.

Inhalational/gastrointestinal/oropharyngeal (treatment, CDC guidelines): I.V.: Initial: 10-15 mg/kg every 12 hours for 60 days (maximum: 500 mg/dose); switch to oral therapy when clinically appropriate; refer to adult dosing for notes on combined therapy and duration

Bacterial conjunctivitis:

Ophthalmic solution: Children >1 year: Refer to adult dosing.

Ophthalmic ointment: Children >2 years: Refer to adult dosing.

Corneal ulcer: Children >1 year: Refer to adult dosing.

Cystic fibrosis (unlabeled use): Children 5-17 years:

Oral: 40 mg/kg/day divided every 12 hours administered following 1 week of I.V. therapy has been reported in a clinical trial; total duration of therapy: 10-21 days

I.V.: 30 mg/kg/day divided every 8 hours for 1 week, followed by oral therapy, has been reported in a clinical trial

Urinary tract infection (complicated) or pyelonephritis: Children 1-17 years:

Oral: 20-30 mg/kg/day in 2 divided doses (every 12 hours) for 10-21 days; maximum: 1.5 g/day

I.V.: 6-10 mg/kg every 8 hours for 10-21 days (maximum: 400 mg/dose)

Dosing: Renal ImpairmentAdults:

Cl_{cr} 30-50 mL/minute: Oral: Administer 250-500 mg every 12 hours.

Cl_{cr} <30 mL/minute: Acute uncomplicated pyelonephritis or complicated UTI: Oral: Extended release formulation: 500 mg every 24 hours

Cl_{cr} 5-29 mL/minute:

Oral: Administer 250-500 mg every 18 hours.

I.V.: Administer 200-400 mg every 18-24 hours.

Dialysis: Only small amounts of ciprofloxacin are removed by hemo- or peritoneal dialysis (<10%); usual dose: Oral: 250-500 mg every 24 hours following dialysis.

Continuous renal replacement therapy (CRRT): I.V.:

CVVH: 200 mg every 12 hours

CVVHD or CVVHDF: 200-400 mg every 12 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer by slow I.V. infusion over 60 minutes into a large vein.

Administration: I.V. DetailAdminister slowly to reduce the risk of venous irritation (burning, pain, erythema, and swelling).

pH: 3.3-3.9 (vials); 3.5-4.6 (PVC bags)

Administration: OralMay administer with food to minimize GI upset; avoid antacid use; maintain proper hydration and urine output. Administer immediate release ciprofloxacin and Cipro® XR at least 2 hours before or 6 hours after, and Proquin® XR at least 4 hours before or 6 hours after antacids or other products containing calcium, iron, or zinc (including dairy products or calcium-fortified juices). Separate oral administration from drugs which may impair absorption (see Drug Interactions).

Oral suspension: Should not be administered through feeding tubes (suspension is oil-based and adheres to the feeding tube). Patients should avoid chewing on the microcapsules.

Nasogastric/orogastric tube: Crush immediate-release tablet and mix with water. Flush feeding tube before and after administration. Hold tube feedings at least 1 hour before and 2 hours after administration.

Tablet, extended release: Do not crush, split, or chew. May be administered with meals containing dairy products (calcium content <800 mg), but not with dairy products alone. Proquin® XR should be administered with a main meal of the day; evening meal is preferred.

Dietary Considerations

Food: Drug may cause GI upset; take without regard to meals (manufacturer prefers that immediate release tablet is taken 2 hours after meals). Extended release tablet may be taken with meals that contain dairy products (calcium content <800 mg), but not with dairy products alone.

Dairy products, calcium-fortified juices, oral multivitamins, and mineral supplements: Absorption of ciprofloxacin is decreased by divalent and trivalent cations. The manufacturer states that the usual dietary intake of calcium (including meals which include dairy products) has not been shown to interfere with ciprofloxacin absorption. Immediate release ciprofloxacin and Cipro® XR may be taken 2 hours before or 6 hours after, and Proquin® XR may be taken 4 hours before or 6 hours after, any of these products.

Caffeine: Patients consuming regular large quantities of caffeinated beverages may need to restrict caffeine intake if excessive cardiac or CNS stimulation occurs.

Storage

Injection:

Premixed infusion: Store between 5°C to 25°C (41°F to 77°F); avoid freezing. Protect from light.

Vial: Store between 5°C to 30°C (41°F to 86°F); avoid freezing. Protect from light. Diluted solutions of 0.5-2 mg/mL are stable for up to 14 days refrigerated or at room temperature.

Ophthalmic solution/ointment: Store at 36°F to 77°F (2°C to 25°C). Protect from light.

Microcapsules for oral suspension: Prior to reconstitution, store below 25°C (77°F). Protect from freezing. Following reconstitution, store below 30°C (86°F) for up to 14 days. Protect from freezing.

Tablet:

Immediate release: Store below 30°C (86°F).

Extended release: Store at room temperature of 15°C to 30°C (59°F to 86°F).

Reconstitution

Injection, vial: May be diluted with NS, D_5W, SWFI, $D_{10}W$, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, LR.

Compatibility

Stable in $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5W, $D_{10}W$, LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solution.

Y-site administration: Compatible: Amifostine, amino acids (dextrose), aztreonam, calcium gluconate, ceftazidime, cisatracurium, clarithromycin, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, etoposide phosphate, gemcitabine, gentamicin, granisetron, hydroxyzine, lidocaine, linezolid, lorazepam, metoclopramide, midazolam, midodrine, piperacillin, potassium acetate, potassium chloride, potassium phosphates, promethazine, ranitidine, remifentanil, Ringer's injection (lactated), sodium chloride, tacrolimus, teniposide, thiotepa, tobramycin, verapamil. **Incompatible:** Aminophylline, ampicillin/sulbactam, cefepime, dexamethasone sodium phosphate, furosemide, heparin, hydrocortisone sodium succinate, methylprednisolone sodium succinate, phenytoin, propofol, sodium phosphates, warfarin. **Variable (consult detailed reference):** Magnesium sulfate, sodium bicarbonate, teicoplanin, TPN.

Compatibility when admixed: Compatible: Amikacin, aztreonam, ceftazidime, cyclosporine, gentamicin, metronidazole, netilmicin, piperacillin, potassium chloride, ranitidine, tobramycin, vitamin B complex. **Incompatible:** Aminophylline, clindamycin, floxacillin, heparin.

Restrictions

An FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Contraindications

Hypersensitivity to ciprofloxacin, any component of the formulation, or other quinolones; concurrent administration of tizanidine

Allergy Considerations

- Fluoroquinolone Allergy

Warnings/Precautions

Boxed Warnings:

- Tendon inflammation/rupture: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Altered cardiac conduction: Fluoroquinolones may prolong QT_c interval; avoid use in patients with a history of QT_c prolongation, uncorrected hypokalemia, hypomagnesemia, or concurrent administration of other medications known to prolong the QT interval (including Class Ia and Class III antiarrhythmics, cisapride, erythromycin, antipsychotics, and tricyclic antidepressants).

- CNS stimulation: Tremor, restlessness, confusion, and very rarely hallucinations or seizures may occur; use with caution in patients with known or suspected CNS disorder. Discontinue in patients who experience significant CNS adverse effects (eg, dizziness, hallucinations, suicidal ideations or actions).

- Crystalluria: Rarely, crystalluria has occurred; urine alkalinity may increase the risk. Ensure adequate hydration during therapy.

- Glucose regulation: Fluoroquinolones have been associated with the development of serious, and sometimes fatal, hypoglycemia. These events have occurred most often in elderly patients with diabetes, but have also been reported in patients without a prior history of diabetes. Prompt identification and treatment of hypoglycemia is essential. Individual quinolones may differ in their potential to cause this effect. It was most evident with gatifloxacin (no longer marketed as s systemic formulation). Hyperglycemia has also been associated with the use of fluoroquinolones. Patients should be monitored closely for signs/symptoms of disordered glucose regulation.

- Hypersensitivity reactions: Severe hypersensitivity reactions, including anaphylaxis, have occurred with quinolone therapy. The spectrum of these reactions can vary widely; reactions may present as typical allergic symptoms (eg, itching, urticaria, rash, edema) after a single dose, or may manifest as severe idiosyncratic dermatologic (eg, Stevens-Johnson, toxic epidermal necrolysis), vascular (eg, vasculitis), pulmonary (eg, pneumonitis), renal (eg, nephritis), hepatic (eg, hepatic failure or necrosis), and/or hematologic (eg, anemia, cytopenias) events, usually after multiple doses. Prompt discontinuation of drug should occur if skin rash or other symptoms arise.

- Peripheral neuropathy: The use of quinolones has been linked to peripheral neuropathy (rare); discontinue if symptoms of sensory or sensorimotor neuropathy occur.

- Phototoxicity: Avoid excessive sunlight and take precautions to limit exposure (eg, loose fitting clothing, sunscreen); may cause moderate-to-severe phototoxicity reactions. Discontinue use if photosensitivity occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

- Tendon inflammation/rupture: **[U.S. Boxed Warning]: There have been reports of tendon inflammation and/or rupture with quinolone antibiotics; risk may be increased with concurrent corticosteroids, organ transplant recipients, and in patients >60 years of age.** Rupture of the Achilles tendon sometimes requiring surgical repair has been reported most frequently; but other tendon sites (eg, rotator cuff, biceps) have also been reported. Strenuous physical activity may be an independent risk factor for tendonitis. Discontinue at first sign of tendon inflammation or pain. May occur even after discontinuation of therapy.

Disease-related concerns:

- Myasthenia gravis: Some quinolones may exacerbate myasthenia gravis, use with caution (rare, potentially life-threatening weakness of respiratory muscles may occur).

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required. May increase risk of tendon rupture.

- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may increase risk of tendon rupture.

- Seizures: Use with caution in individuals at risk of seizures (CNS disorders or concurrent therapy with medications which may lower seizure threshold). Potential for seizures, although very rare, may be increased with concomitant NSAID therapy.

- Syphilis: Since ciprofloxacin is ineffective in the treatment of syphilis and may mask symptoms, all patients should be tested for syphilis at the time of gonorrheal diagnosis and 3 months later.

Concurrent drug therapy issues:

- CYP1A2 substrates: Ciprofloxacin is a potent inhibitor of CYP1A2. Coadministration of drugs which depend on this pathway may lead to substantial increases in serum concentrations and adverse effects.

Special populations:

- Elderly: Adverse effects (eg, tendon rupture, QT changes) may be increased in the elderly.

- G6PD deficiency: Hemolytic reactions may (rarely) occur with quinolone use in patients with latent or actual G6PD deficiency.

- Pediatrics: Adverse effects, including those related to joints and/or surrounding tissues, are increased in pediatric patients and therefore, ciprofloxacin should not be considered as drug of choice in children (exception is anthrax treatment).

Geriatric ConsiderationsSee Warnings/Precautions regarding tendon rupture in patients >60 years of age. Ciprofloxacin should not be used as first-line therapy unless the culture and sensitivity findings show resistance to usual therapy. The interactions with caffeine and theophylline can result in serious toxicity in the elderly. Adjust dose for renal function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in some animal studies; therefore, the manufacturer classifies ciprofloxacin as pregnancy category C. Ciprofloxacin crosses the placenta and produces measurable concentrations in the amniotic fluid and cord serum. An increased risk of teratogenic effects has not been observed in animals or humans following ciprofloxacin use during pregnancy; however, because of concerns of cartilage damage in immature animals, ciprofloxacin should only be used during pregnancy if a safer option is not available. Ciprofloxacin is recommended for prophylaxis and treatment of pregnant women exposed to anthrax. Serum concentrations of ciprofloxacin may be lower during pregnancy than in nonpregnant patients.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsCiprofloxacin is excreted in breast milk. Breast-feeding is not recommended by the manufacturer. The AAP considers ciprofloxacin to be “usually compatible with breast-feeding.” Due to the low concentrations in human milk, minimal toxicity would be expected in the nursing infant and infant serum levels were undetectable in one report. Nondose-related effects could include modification of bowel flora. There has been a single case report of perforated pseudomembranous colitis in a breast-feeding infant whose mom was taking ciprofloxacin.

Pregnancy & Lactation, In-Depth

- Ciprofloxacin in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Neurologic events (children 2%, includes dizziness, insomnia, nervousness, somnolence); fever (children 2%); headache (I.V. administration); restlessness (I.V. administration)

Dermatologic: Rash (children 2%, adults 1%)

Gastrointestinal: Nausea (children/adults 3%); diarrhea (children 5%, adults 2%); vomiting (children 5%, adults 1%); abdominal pain (children 3%, adults <1%); dyspepsia (children 3%)

Hepatic: ALT increased, AST increased (adults 1%)

Local: Injection site reactions (I.V. administration)

Respiratory: Rhinitis (children 3%)

<1%: Abnormal gait, acute renal failure, agitation, allergic reactions, anaphylaxis, anemia, angina pectoris, angioedema, anorexia, arthralgia, ataxia, atrial flutter, breast pain, bronchospasm, candidiasis, cardiopulmonary arrest, cerebral thrombosis, chills, cholestatic jaundice, confusion, chromatopsia, crystalluria (particularly in alkaline urine), cylindruria, depersonalization, depression, dizziness, drowsiness, dyspnea, edema, eosinophilia, erythema nodosum, fever (adults), gastrointestinal bleeding, hallucinations, headache (oral), hematuria, hyperpigmentation, hyper-/hypotension, insomnia, interstitial nephritis, intestinal perforation, irritability, joint pain, laryngeal edema, lightheadedness, lymphadenopathy, malaise, manic reaction, migraine, MI, nephritis, nightmares, palpitation, paranoia, paresthesia, peripheral neuropathy, petechia, photosensitivity, pulmonary edema, seizure, syncope, tachycardia, thrombophlebitis, tinnitus, tremor, urethral bleeding, vaginitis, ventricular ectopy, visual disturbance, weakness

Postmarketing and/or case reports: Agranulocytosis, albuminuria, anaphylactic shock, anosmia, bone marrow depression (life-threatening), candiduria, constipation, delirium, dyspepsia (adults), dysphagia, erythema multiforme, exfoliative dermatitis, fixed eruption, flatulence, hemolytic anemia, hepatic failure (some fatal), hepatic necrosis, hyperesthesia, hyperglycemia, hypertonia, jaundice, methemoglobinemia, moniliasis, myalgia, myasthenia gravis, myoclonus, nystagmus, orthostatic hypotension, pancreatitis, pancytopenia (life-threatening or fatal), pneumonitis, prolongation of PT/INR, pseudomembranous colitis, psychosis, renal calculi, serum cholesterol increased, serum glucose increased, serum sickness-like reactions, serum triglycerides increased, Stevens-Johnson syndrome, taste loss, tendon rupture, tendonitis, toxic epidermal necrolysis (Lyell's syndrome), torsade de pointes, twitching, vaginal candidiasis, vasculitis

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Inhibits** CYP1A2 (strong), 3A4 (weak)
Drug Interactions

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Caffeine: Quinolone Antibiotics may decrease the metabolism of Caffeine. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Methotrexate: Ciprofloxacin may increase the serum concentration of Methotrexate. *Risk C: Monitor therapy*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Pentoxifylline: Ciprofloxacin may enhance the adverse/toxic effect of Pentoxifylline. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Ciprofloxacin may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

QTc-Prolonging Agents: Ciprofloxacin may enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Ropinirole: Ciprofloxacin may decrease the metabolism of Ropinirole. *Risk C: Monitor therapy*

Ropivacaine: Ciprofloxacin may decrease the metabolism of Ropivacaine. *Risk C: Monitor therapy*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hyperglycemic effect of Sulfonylureas. Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Theophylline Derivatives: Quinolone Antibiotics may decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

TiZANidine: Ciprofloxacin may decrease the metabolism of TiZANidine. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Food decreases rate, but not extent, of absorption. Ciprofloxacin serum levels may be decreased if taken with dairy products or calcium-fortified juices. Ciprofloxacin may increase serum caffeine levels if taken with caffeine.

Enteral feedings may decrease plasma concentrations of ciprofloxacin probably by >30% inhibition of absorption. Ciprofloxacin should not be administered with enteral feedings. The feeding would need to be discontinued for 1-2 hours prior to and after ciprofloxacin administration. Nasogastric administration produces a greater loss of ciprofloxacin bioavailability than does nasoduodenal administration.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersPatients receiving concurrent ciprofloxacin, theophylline, or cyclosporine should have serum levels monitored; CBC, renal and hepatic function during prolonged therapy

Reference RangeTherapeutic: 2.6-3 mcg/mL; Toxic: >5 mcg/mL

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests prior to beginning therapy. Use caution in patients with known or suspected CNS disorder, current or potential for QT prolongation, renal or hepatic impairment, or diabetes. Assess other pharmacological or herbal products patient may be taking for potential interactions. I.V.: See Administration specifics. Evaluate results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse effects (eg, hypersensitivity reactions [severe reactions, including anaphylaxis, have occurred with quinolone therapy]; *C. difficile*-associated colitis [can occur up to 2 months post treatment]; changes in CNS) regularly during prolonged therapy. Teach patient proper use (appropriate for formulation), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, renal and hepatic function during prolonged therapy; patients receiving concurrent ciprofloxacin, theophylline, or cyclosporine should have serum theophylline or cyclosporine levels monitored. Culture and sensitivity specimen should be taken prior to initiating therapy.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. If administered by infusion, report immediately any redness, swelling, or pain at infusion site; any swelling of mouth, lips, tongue, or throat; chest pain or tightness; respiratory difficulty; back pain; and sudden itching or skin rash. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Oral: Take exactly according to specific directions (eg, timing with meals, dairy products, antacids or products containing calcium, iron or zinc differs with each formulation). Take all of prescribed medication, even if feeling better. Do not crush, split, or chew extended release tablets or chew on microcapsules in oral suspension. Maintain adequate hydration (2-3 L/day) unless instructed to restrict fluid intake. Consult prescriber before having any vaccinations. You may experience nausea, vomiting, or anorexia (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help) or increased sensitivity to sunlight (use sunscreen, wear protective clothing and dark glasses, and avoid direct exposure to sunlight or tanning salons). If tendon inflammation or pain occurs or you experience signs of an allergic reaction (eg, itching, skin rash, respiratory difficulty, facial edema or difficulty swallowing, loss of consciousness, tingling, chest pain, palpitations), discontinue use and contact prescriber immediately. Report persistent GI disturbances; CNS changes (eg, excessive sleepiness, agitation, tremors); vision changes; respiratory difficulty; signs of opportunistic infection (eg, sore throat, chills, fever, burning, itching on urination, vaginal discharge, white plaques in mouth); persistent diarrhea (especially if it lasts or occurs after completing prescription), or worsening of condition.

Ophthalmic: Use exactly as directed. Wash hands prior to instilling eye medication. Do not touch dropper to eye or any other surface. Do not wear contact lenses while using this medication (check with prescriber before using again). Tilt head back, look upward, and pull lower eyelid down to make a pouch. Drop prescribed number of drops directly into eye. Close eye, place one finger at corner of eye near nose, and apply gentle pressure. Do not blink or rub eye. If also using ointment, use drops before ointment. Use for exact time as prescribed; do not discontinue, even if symptoms disappear. May cause temporary stinging or burning. Report persistent eye discomfort, itching, redness, unusual tearing, feeling as if something is in your eye, blurred vision, eye pain, worsening vision, a bad taste in your mouth, sensitivity to light, skin rash, difficulty breathing, or worsening of symptoms.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in D_5W]: 200 mg (100 mL); 400 mg (200 mL)

Cipro®: 200 mg (100 mL); 400 mg (200 mL)

Injection, solution [concentrate]: 10 mg/mL (20 mL, 40 mL, 120 mL)

Cipro®: 10 mg/mL (20 mL, 40 mL)

Microcapsules for suspension, oral:

Cipro®: 250 mg/5 mL (100 mL); 500 mg/5 mL (100 mL) [strawberry flavor]

Ointment, ophthalmic, as hydrochloride:

Ciloxan®: 3.33 mg/g (3.5 g) [0.3% base]

Solution, ophthalmic, as hydrochloride: 3.5 mg/mL (2.5 mL, 5mL, 10 mL) [0.3% base]

Ciloxan®: 3.5 mg/mL (5 mL) [0.3% base; contains benzalkonium chloride]

Tablet, as hydrochloride: 100 mg [strength expressed as base], 250 mg [strength expressed as base], 500 mg [strength expressed as base], 750 mg [strength expressed as base]

Cipro®: 250 mg [strength expressed as base], 500 mg [strength expressed as base], 750 mg [strength expressed as base]

Tablet, extended release, as base and hydrochloride: 500 mg [strength expressed as base], 1000 mg [strength expressed as base]

Cipro® XR: 500 mg [strength expressed as base], 1000 mg [strength expressed as base]

Tablet, extended release, as hydrochloride:

Proquin® XR: 500 mg [strength expressed as base]

Tablet, extended release, as hydrochloride [dose pack]:

Proquin® XR: 500 mg (3s)

Generic AvailableYes: Excludes ointment, suspension
ManufacturerBayer Corp (Biological and Pharmaceutical Division)
Pricing: U.S. (www.drugstore.com)

Solution (Ciloxan)

0.3% (5): $61.99

Solution (Cipro)

400 mg (40): $259.99

Solution (Ciprofloxacin HCl)

0.3% (2.5): $19.99

0.3% (5): $29.99

0.3% (10): $59.99

Tablet, 24-hour (Cipro XR)

500 mg (20): $187.54

Tablet, 24-hour (Ciprofloxacin-Ciproflox HCl)

500 mg (50): $394.99

Tablet, 24-hour (ProQuin XR)

500 mg (3): $39.99

500 mg (50): $499.99

Tablets (Cipro)

500 mg (30): $177.10

Tablets (Ciprofloxacin HCl)

250 mg (30): $16.99

500 mg (100): $39.99

750 mg (30): $135.99

750 mg (100): $429.99

Mechanism of ActionInhibits DNA-gyrase in susceptible organisms; inhibits relaxation of supercoiled DNA and promotes breakage of double-stranded DNA

Pharmacodynamics/Kinetics

Absorption: Oral: Immediate release tablet: Rapid (~50% to 85%)

Distribution: V_d: 2.1-2.7 L/kg; tissue concentrations often exceed serum concentrations especially in kidneys, gallbladder, liver, lungs, gynecological tissue, and prostatic tissue; CSF concentrations: 10% of serum concentrations (noninflamed meninges), 14% to 37% (inflamed meninges)

Protein binding: 20% to 40%

Metabolism: Partially hepatic; forms 4 metabolites (limited activity)

Half-life elimination: Children: 2.5 hours; Adults: Normal renal function: 3-5 hours

Time to peak: Oral:

Immediate release tablet: 0.5-2 hours

Extended release tablet: Cipro® XR: 1-2.5 hours, Proquin® XR: 3.5-8.7 hours

Excretion: Urine (30% to 50% as unchanged drug); feces (15% to 43%)

Pharmacotherapy PearlsAlthough the systemic use of ciprofloxacin is only FDA approved in children for the treatment of complicated UTI and postexposure treatment of inhalation anthrax, use of the fluoroquinolones in pediatric patients is increasing. Current recommendations by the American Academy of Pediatrics note that the systemic use of these agents in children should be restricted to infections caused by multidrug resistant pathogens with no safe or effective alternative, and when parenteral therapy is not feasible or other oral agents are not available.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusConvulsions and toxic psychosis have been reported with quinolones. May cause dizziness, confusion, hallucinations, depression, and rarely suicidal ideation and attempts. These reactions may occur after the first dose. Discontinue drug and institute safety measures. Ciprofloxacin may also cause nervousness, agitation, insomnia, anxiety, nightmares or paranoia, phobia, depersonalization, manic reaction, ataxia, irritability, and drowsiness.

Mental Health: Effects on Psychiatric TreatmentInhibits CYP1A2 isoenzyme; use caution with clozapine; monitor for adverse effects. May rarely cause agranulocytosis; monitor with clozapine and carbamazepine. Use caution in patients with CNS disorders that may predispose them to seizures (epilepsy, alcohol/sedative hypnotic withdrawal).

Cardiovascular ConsiderationsCiprofloxacin has been weakly associated with torsade de pointes and/or QT prolongation, but is unlikely to be a risk for torsade de pointes when used in the usual recommended dosages and in patients **without** other risk factors (eg, concomitant QT-prolonging drugs, bradycardia, electrolyte disturbances, congenital long QT syndrome, concomitant drugs that inhibit metabolism). Ciprofloxacin should not be used in patients with congenital prolonged QT syndrome.

Index TermsCiprofloxacin Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Propulsid® may be confused with propranolol

Pronunciation(SIS a pride)

U.S. Brand NamesPropulsid®

Pharmacologic CategoryGastrointestinal Agent, Prokinetic

Use: Labeled IndicationsTreatment of nocturnal symptoms of gastroesophageal reflux disease (GERD); has demonstrated effectiveness for gastroparesis, refractory constipation, and nonulcer dyspepsia

Dosing: AdultsGERD or gastrointestinal dysmotility: Oral: Initial: 5-10 mg 4 times/day at least 15 minutes before meals and at bedtime; in some patients the dosage will need to be increased to 20 mg to obtain a satisfactory result.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricGastrointestinal dysmotility: Oral: Children: 0.15-0.3 mg/kg/dose 3-4 times/day; maximum: 10 mg/dose

Dosing: Hepatic ImpairmentInitiate at 50% usual dose.

RestrictionsIn U.S., available via limited-access protocol only (1-800-JANSSEN).

Contraindications

Hypersensitivity to cisapride or any component of the formulations; GI hemorrhage, mechanical obstruction, GI perforation, or other situations when GI motility stimulation is dangerous

Serious cardiac arrhythmias including ventricular tachycardia, ventricular fibrillation, torsade de pointes, and QT prolongation have been reported in patients taking cisapride with other drugs that inhibit CYP3A4. Some of these events have been fatal. Concomitant oral or intravenous administration of the following drugs with cisapride may lead to elevated cisapride blood levels and is contraindicated:

Antibiotics: Oral or I.V. erythromycin, clarithromycin, troleandomycin

Antidepressants: Nefazodone

Antifungals: Oral or I.V. fluconazole, itraconazole, miconazole, oral ketoconazole

Protease inhibitors: Indinavir, ritonavir, amprenavir, atazanavir

Cisapride is also contraindicated for patients with a prolonged electrocardiographic QT intervals (QT_c >450 msec), a history of QT_c prolongation, or known family history of congenital long QT syndrome; clinically significant bradycardia, renal failure, history of ventricular arrhythmias, ischemic heart disease, and congestive heart failure; uncorrected electrolyte disorders (hypokalemia, hypomagnesemia); respiratory failure; and concomitant medications known to prolong the QT interval and increase the risk of arrhythmia, such as certain antiarrhythmics, certain antipsychotics, certain antidepressants, bepridil, sparfloxacin, and terodiline. The preceding lists of drugs are not comprehensive. Cisapride should not be used in patients with uncorrected hypokalemia or hypomagnesemia or who might experience rapid reduction of plasma potassium such as those administered potassium-wasting diuretics and/or insulin in acute settings.

Warnings/Precautions

Special note:

On March 24, 2000, the FDA announced that the manufacturer of cisapride would voluntarily withdraw its product from the U.S. market on July 14, 2000. This decision was based on 341 reports of heart rhythm abnormalities including 80 reports of deaths. The company will continue to make the drug available to patients who meet specific clinical eligibility criteria for a limited-access protocol (contact 1-800-JANSSEN).

Boxed warnings:

- Arrhythmias: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Arrhythmias: **[U.S. Boxed Warning]: Serious cardiac arrhythmias including ventricular tachycardia, ventricular fibrillation, torsade de pointes, and QT prolongation have been reported in patients taking this drug.** Many of these patients also took drugs expected to increase cisapride blood levels by inhibiting the cytochrome P450 3A4 enzymes that metabolize cisapride. These drugs include clarithromycin, erythromycin, troleandomycin, nefazodone, fluconazole, itraconazole, ketoconazole, indinavir and ritonavir. Some of these events have been fatal. Cisapride is contraindicated in patients taking any of these drugs. **QT prolongation, torsade de pointes (sometimes with syncope), cardiac arrest and sudden death have been reported in patients taking cisapride without the above-mentioned contraindicated drugs.** Most patients had disorders that may have predisposed them to arrhythmias with cisapride. Cisapride is contraindicated for those patients with: history of prolonged electrocardiographic QT intervals; renal failure; history of ventricular arrhythmias, ischemic heart disease, and HF;

uncorrected electrolyte disorders (hypokalemia, hypomagnesemia); respiratory failure; and concomitant medications known to prolong the QT interval and increase the risk of arrhythmia, such as certain antiarrhythmics, including those of Class Ia (such as quinidine and procainamide) and Class III (such as sotalol); tricyclic antidepressants (such as amitriptyline); certain tetracyclic antidepressants (such as maprotiline); certain antipsychotic medications (such as certain phenothiazines and sertindole), protease inhibitors, bepridil, sparfloxacin and terodiline. (The preceding lists of drugs are not comprehensive.) Recommended doses of cisapride should not be exceeded.

Disease-related concerns:

- Electrolyte disturbances: Should not be used in patients with uncorrected hypokalemia or hypomagnesemia, such as those with severe dehydration, vomiting or malnutrition, or those taking potassium-wasting diuretics; should also not be used in patients who might experience rapid reduction of plasma potassium, such as those administered potassium-wasting diuretics and/or insulin in acute settings.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Risk vs. benefit: Potential benefits should be weighed against risks prior administration of cisapride to patients who have or may develop prolongation of cardiac conduction intervals, particularly QT_c. These include patients with conditions that could predispose them to the development of serious arrhythmias, such as multiple organ failure, COPD, apnea and advanced cancer. Patients should have a baseline ECG and an electrolyte panel (magnesium, calcium, potassium) prior to initiating cisapride (see Contraindications).

Geriatric ConsiderationsSteady-state serum concentrations are higher than those in younger adults; however, the therapeutic dose and pharmacologic effects are the same as those in younger adults and no adjustment in dose recommended for elderly.
Pregnancy Risk FactorC
LactationEnters breast milk/use caution (AAP rates “compatible”)
Adverse Reactions

>5%:

Central nervous system: Headache

Dermatologic: Rash

Gastrointestinal: Diarrhea, GI cramping, dyspepsia, flatulence, nausea, xerostomia

Respiratory: Rhinitis

<5%:

Cardiovascular: Tachycardia

Central nervous system: Extrapyramidal effects, somnolence, fatigue, seizure, insomnia, anxiety

Hematologic: Thrombocytopenia, increased LFTs, pancytopenia, leukopenia, granulocytopenia, aplastic anemia

Respiratory: Sinusitis, cough, upper respiratory tract infection, increased incidence of viral infection

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak), 3A4 (weak)
Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amitriptyline: May enhance the arrhythmogenic effect of Cisapride. *Risk X: Avoid combination*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Aprepitant: May increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Cimetidine: May decrease the metabolism of Cisapride. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Efavirenz: May enhance the QTc-prolonging effect of Cisapride. *Risk X: Avoid combination*

Fosaprepitant: May increase the serum concentration of Cisapride. The active metabolite aprepitant is likely responsible for this effect. *Risk X: Avoid combination*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of Cisapride. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Cisapride. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk X: Avoid combination*

Nefazodone: May decrease the metabolism of Cisapride. *Risk X: Avoid combination*

NIFEdipine: Cisapride may increase the serum concentration of NIFEdipine. Reported with sustained release nifedipine product. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Protease Inhibitors: May decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Protriptyline: May enhance the arrhythmogenic effect of Cisapride. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Coadministration of grapefruit juice with cisapride increases the bioavailability of cisapride and concomitant use should be avoided.

Herb/Nutraceutical: St John's wort may decrease cisapride levels.

Nursing: Physical Assessment/MonitoringEvaluate cardiac status thoroughly prior to therapy (12-lead ECG). Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, anything that may increase risk of cardiac arrhythmias). Assess results of laboratory tests (eg, ECG, electrolyte balance, and renal function), therapeutic effectiveness (relief of symptoms), and adverse response (eg, tachycardia, CNS changes, anemia, viral infection) regularly during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab Tests**A 12-lead ECG should be performed prior to administration of cisapride.** Treatment with cisapride should not be initiated if the QT_c value exceeds 450 milliseconds. Serum electrolytes (potassium, calcium, and magnesium) and creatinine should be assessed prior to administration of cisapride and whenever conditions develop that may affect electrolyte balance or renal function.

Patient EducationIt is absolutely vital that you inform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take before meals. Avoid alcohol and grapefruit juice. May cause increased sedation, headache, anxiety (use caution when driving or engaging in hazardous tasks until response to drug is known). Immediately report rapid heartbeat, palpitations, chest pain, or tightness. Report severe abdominal pain, prolonged diarrhea, weight loss, extreme fatigue, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Generic AvailableNo

ManufacturerJanssen Pharmaceutica Products, LP

Mechanism of ActionEnhances the release of acetylcholine at the myenteric plexus. *In vitro* studies have shown cisapride to have serotonin-4 receptor agonistic properties which may increase gastrointestinal motility and cardiac rate; increases lower esophageal sphincter pressure and lower esophageal peristalsis; accelerates gastric emptying of both liquids and solids.

Pharmacodynamics/Kinetics

Onset of action: 0.5-1 hour

Protein binding: 97.5% to 98%

Metabolism: Extensively hepatic to norcisapride

Bioavailability: 35% to 40%

Half-life elimination: 6-12 hours

Excretion: Urine and feces (<10%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsCisapride is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause sedation, insomnia, anxiety, or extrapyramidal symptoms

Mental Health: Effects on Psychiatric TreatmentContraindicated with nefazodone and ziprasidone; may increase cisapride levels which have been associated with QT prolongation and torsade de pointes

Cardiovascular ConsiderationsRecent concerns have arisen regarding the arrhythmogenic potential of cisapride. Cisapride is associated with serious cardiac arrhythmias including ventricular tachycardia, ventricular fibrillation, torsade de pointes, and QT prolongation. For these reasons, cisapride should be avoided in patients with cardiovascular disease, particularly in those patients with a history of arrhythmias or prolonged QT interval, ischemic heart disease, heart failure, respiratory failure, renal failure, and conditions which may predispose to electrolyte imbalances (hypokalemia, hypocalcemia, hypomagnesemia). Cisapride levels and the potential for arrhythmogenic effects may also increase secondary to significant drug interactions (see Drug Interactions). Cisapride therapy is contraindicated with macrolide antibiotics (eg, clarithromycin, erythromycin, troleandomycin), antifungals (eg, fluconazole, itraconazole, ketoconazole), protease inhibitors (eg, indinavir, ritonavir), phenothiazines (eg, prochlorperazine, promethazine), antiarrhythmics (Class Ia agents: quinidine, procainamide, disopyramide and Class III agents: amiodarone, sotalol), and tricyclic antidepressants, nefazodone, maprotiline, sertindole, bepridil, and sparfloxacin.

In the absence of a known disease or drug contraindication, all patients should have a 12-lead ECG and an electrolyte panel (potassium, calcium, and magnesium) completed prior to initiating cisapride therapy. Cisapride is contraindicated in patients with hypokalemia, hypocalcemia, hypomagnesemia, and in patients with a QT_c interval >450 milliseconds. Serum electrolytes and 12-lead ECG should be again evaluated within the first 48 hours of therapy and periodically thereafter. Patients on diuretic and cisapride therapies should be monitored more closely for the development of hypokalemia, hypocalcemia, and hypomagnesemia. Cisapride therapy should be stopped and the patient monitored closely in patients who develop hypokalemia, hypocalcemia, hypomagnesemia, or QT prolongation (QT_c >450 milliseconds).

Anesthesia and Critical Care Concerns/Other Considerations

IMPORTANT NOTE: On March 24, 2000, the FDA announced that the manufacturer of cisapride would voluntarily withdraw its product from the U.S. market on July 14, 2000. This decision was based on 341 reports of heart rhythm abnormalities including 80 reports of deaths. The company will continue to make the drug available to patients who meet specific clinical eligibility criteria for a limited-access protocol (contact 1-800-JANSSEN).

The potential for arrhythmogenic effects may also increase secondary to significant drug interactions (see Drug Interactions).

In the absence of a known disease or drug contraindication, all patients should have a 12-lead ECG and an electrolyte panel (potassium, calcium, and magnesium) completed prior to initiating cisapride therapy. Serum electrolytes and 12-lead ECG should be again evaluated within the first 48 hours of therapy and periodically thereafter. Patients on diuretic and cisapride therapies should be monitored more closely for the development of hypokalemia, hypocalcemia, and hypomagnesemia. Cisapride therapy should be stopped and the patient monitored closely in patients who develop hypokalemia, hypocalcemia, hypomagnesemia, or QT prolongation.

Medication Safety Issues

Sound-alike/look-alike issues:

Nimbex® may be confused with Revex®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(sis a tra KYOO ree um)

U.S. Brand NamesNimbex®

Canadian Brand NamesNimbex®

Pharmacologic CategoryNeuromuscular Blocker Agent, Nondepolarizing

Use: Labeled IndicationsAdjunct to general anesthesia to facilitate endotracheal intubation and to relax skeletal muscles during surgery; to facilitate mechanical ventilation in ICU patients; does not relieve pain or produce sedation

Dosing: AdultsNeuromuscular blockade: I.V. (not to be used I.M.):

Operating room administration:

Intubating doses: 0.15-0.2 mg/kg as components of propofol/nitrous oxide/oxygen induction-intubation technique. (**Note:** May produce generally good or excellent conditions for tracheal intubation in 1.5-2 minutes with clinically effective duration of action during propofol anesthesia of 55-61 minutes.) Initial dose after succinylcholine for intubation: 0.1 mg/kg; maintenance dose: 0.03 mg/kg 40-60 minutes after initial dose, then at ~20-minute intervals based on clinical criteria.

Continuous infusion: After an initial bolus, a diluted solution can be given by continuous infusion for maintenance of neuromuscular blockade during extended surgery; adjust the rate of administration according to the patient's response as determined by peripheral nerve stimulation. An initial infusion rate of 3 mcg/kg/minute may be required to rapidly counteract the spontaneous recovery of neuromuscular function; thereafter, a rate of 1-2 mcg/kg/minute should be adequate to maintain continuous neuromuscular block in the 89% to 99% range in most pediatric and adult patients. Consider reduction of the infusion rate by 30% to 40% when administering during stable isoflurane, enflurane, sevoflurane, or desflurane anesthesia. Spontaneous recovery from neuromuscular blockade following discontinuation of infusion of cisatracurium may be expected to proceed at a rate comparable to that following single bolus administration.

Intensive care unit administration: Follow the principles for infusion in the operating room. At initial signs of recovery from bolus dose, begin the infusion at a dose of 3 mcg/kg/minute and adjust rates accordingly; dosage ranges of 0.5-10 mcg/kg/minute have been reported. If patient is allowed to recover from neuromuscular blockade, readministration of a bolus dose may be necessary to quickly re-establish neuromuscular block prior to reinstituting the infusion. See table.

Cisatracurium Besylate Infusion Chart

Drug Delivery Rate (mcg/kg/min)	**Infusion Rate (mL/kg/min) 0.1 mg/mL (10 mg/100 mL)**	**Infusion Rate (mL/kg/min) 0.4 mg/mL (40 mg/100 mL)**
1	0.01	0.0025
1.5	0.015	0.00375
2	0.02	0.005
3	0.03	0.0075
5	0.05	0.0125

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricNeuromuscular blockade: I.V. (not to be used I.M.):

Operating room administration:

Infants 1-23 months: 0.15 mg/kg over 5-10 seconds during either halothane or opioid anesthesia

Children 2-12 years: *Intubating doses:* 0.1-0.15 mg/kg over 5-15 seconds during either halothane or opioid anesthesia. (**Note:** When given during stable opioid/nitrous oxide/oxygen anesthesia, 0.1 mg/kg produces maximum neuromuscular block in an average of 2.8 minutes and clinically effective block for 28 minutes.)

Children ≥2 years: *Continuous infusion:* Refer to adult dosing.

Intensive care unit administration: Refer to adult dosing.

Dosing: Renal ImpairmentBecause slower times to onset of complete neuromuscular block were observed in renal dysfunction patients, extending the interval between the administration of cisatracurium and intubation attempt may be required to achieve adequate intubation conditions.

Calculations

- Cisatracurium

Administration: I.M.Not for I.M. injection, too much tissue irritation.

Administration: I.V.Administer I.V. only. The use of a peripheral nerve stimulator will permit the most advantageous use of cisatracurium, minimize the possibility of overdosage or underdosage and assist in the evaluation of recovery.

Give undiluted as a bolus injection. Continuous administration requires the use of an infusion pump.

StorageRefrigerate intact vials at 2°C to 8°C/36°F to 46°F. Use vials within 21 days upon removal from the refrigerator to room temperature (25°C to 77°F). Dilutions of 0.1-0.2 mg/mL in 0.9% sodium chloride or dextrose 5% in water are stable for up to 24 hours at room temperature.

CompatibilityStable in D_5W, NS, D_5NS; **variable stability (consult detailed reference)** in D_5LR.

Y-site administration: Compatible: Alfentanil, amikacin, aztreonam, bretylium, bumetanide, buprenorphine, butorphanol, calcium gluconate, ceftriaxone, chlorpromazine, cimetidine, ciprofloxacin, clindamycin, dexamethasone sodium phosphate, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, esmolol, famotidine, fentanyl, fluconazole, gatifloxacin, gentamicin, haloperidol, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, metoclopramide, metronidazole, midazolam, minocycline, morphine, nalbuphine, nitroglycerin, norepinephrine, ofloxacin, ondansetron, phenylephrine, potassium chloride, procainamide, prochlorperazine edisylate, promethazine, ranitidine, remifentanil, sufentanil, theophylline, ticarcillin, tobramycin, vancomycin, zidovudine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, cefoperazone. **Variable (consult detailed reference):** Acyclovir, aminophylline, amphotericin B, ampicillin, ampicillin/sulbactam, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, diazepam, furosemide, ganciclovir, heparin, methylprednisolone sodium succinate, piperacillin, piperacillin/tazobactam, sodium bicarbonate, sodium nitroprusside, thiopental, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.

Compatibility when admixed: Compatible: Alfentanil, droperidol, fentanyl, midazolam, sufentanil. **Incompatible:** Ketorolac, propofol.

ContraindicationsHypersensitivity to cisatracurium besylate or any component of the formulation

Allergy Considerations

- Neuromuscular-Blocking Agent Allergy

Warnings/Precautions

Concern related to adverse effects:

- Bradycardia: May be more common with cisatracurium than with other neuromuscular-blocking agents since it has no clinically-significant effects on heart rate to counteract the bradycardia produced by anesthetics.
- Neuromuscular cross-sensitivity: Cross-sensitivity with other neuromuscular-blocking agents may occur; use extreme caution in patients with previous anaphylactic reactions.

Disease-related concerns:

- Burn injury: Resistance may occur in burn patients (>30% of body) for period of 5-70 days postinjury.
- Conditions which may antagonize neuromuscular blockade: Alkalosis, hypercalcemia, demyelinating lesions, peripheral neuropathies, denervation, infection, muscle trauma, and diabetes mellitus may result in antagonism of neuromuscular blockade.
- Conditions which may potentiate neuromuscular blockade: Electrolyte abnormalities, severe hyponatremia, severe hypocalcemia, severe hypokalemia, hypermagnesemia, neuromuscular diseases, acidosis, acute intermittent porphyria, Eaton-Lambert syndrome, myasthenia gravis, renal failure, and hepatic failure may result in potentiation of neuromuscular blockade.

Special populations:

- Elderly: Use with caution in the elderly, effects and duration are more variable.
- Immobilized patients: Resistance may occur in patients who are immobilized.

Other warnings/precautions:

- Appropriate use: Maintenance of an adequate airway and respiratory support is critical.
- Experienced personnel: Should be administered by adequately trained individuals familiar with its use.

Pregnancy Risk FactorB

Lactation Excretion in breast milk unknown/use caution

Adverse Reactions

<1%: Effects are minimal and transient, bradycardia and hypotension, flushing, pruritus, rash, bronchospasm

Postmarketing and/or case reports: Acute quadriplegic myopathy syndrome (prolonged use), myositis ossificans (prolonged use)

Drug Interactions

Acetylcholinesterase Inhibitors: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). Acetylcholinesterase Inhibitors may decrease the metabolism of Neuromuscular-Blocking Agents (Nondepolarizing). This is only true for mivacurium in which case the neuromuscular blocking effects might be prolonged. *Risk C: Monitor therapy*

Aminoglycosides: May enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcium Channel Blockers: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Cardiac Glycosides: Neuromuscular-Blocking Agents may enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Colistimethate: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Neuromuscular-Blocking Agents (Nondepolarizing) may enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Inhalational Anesthetics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Neuromuscular-Blocking Agents (Nondepolarizing). Specifically, episodes of apnea have been reported in patients using this combination. *Risk C: Monitor therapy*

Lincosamide Antibiotics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Lithium: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Loop Diuretics: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Magnesium Salts: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Polymyxin B: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Procainamide: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

QuiNIDine: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Vancomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Monitoring Parameters Vital signs (heart rate, blood pressure, respiratory rate)

Nursing: Physical Assessment/Monitoring Only clinicians experienced in the use of neuromuscular blocking drugs should administer and/or manage the use of cisatracurium. Dosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medications, age, and general condition of the patient. Ventilatory support must be instituted and maintained until adequate respiratory muscle function and/or airway protection are assured. Assess other medications for effectiveness and safety. Other drugs that affect neuromuscular activity may increase/decrease neuromuscular block induced by cisatracurium. This drug does not cause anesthesia or analgesia; pain must be treated with appropriate analgesic agents. Continuous monitoring of vital signs, cardiac status, respiratory status, and degree of neuromuscular block (objective assessment with peripheral external nerve stimulator) is mandatory during infusion and until full muscle tone has returned. Muscle tone returns in a predictable pattern, starting with diaphragm, abdomen, chest, limbs, and finally muscles of the neck, face, and eyes. Safety precautions must be maintained until full muscle tone has returned. **Note:** It may take longer for return of muscle tone in obese or elderly patients or patients with renal or hepatic disease, myasthenia gravis, myopathy, other neuromuscular disease, dehydration, electrolyte imbalance, or severe acid/base imbalance. Provide appropriate patient teaching/support prior to and following administration.

Long-term use: Monitor fluid levels (intake and output) during and following infusion. Reposition patient and provide appropriate skin care, mouth care, and care of patient's eyes every 2-3 hours while sedated. Provide appropriate emotional and sensory support (auditory and environmental).

Patient Education Patient will usually be unconscious prior to administration. Patient education should be appropriate to individual situation. Reassurance of constant monitoring and emotional support to reduce fear and anxiety should precede and follow administration. Following return of muscle tone, do not attempt to change position or rise from bed without assistance. Report immediately any skin rash or hives, pounding heartbeat, respiratory difficulty, or muscle tremors. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 2 mg/mL (5 mL); 10 mg/mL (20 mL)

Injection, solution: 2 mg/mL (10 mL) [contains benzyl alcohol]

Generic AvailableNo

Mechanism of ActionBlocks neural transmission at the myoneural junction by binding with cholinergic receptor sites

Pharmacodynamics/Kinetics

Onset of action: I.V.: 2-3 minutes

Peak effect: 3-5 minutes

Duration: Recovery begins in 20-35 minutes when anesthesia is balanced; recovery is attained in 90% of patients in 25-93 minutes

Metabolism: Undergoes rapid nonenzymatic degradation in the bloodstream (Hofmann elimination), additional metabolism occurs via ester hydrolysis; some active metabolites

Half-life elimination: 22-29 minutes

Related Information

- Neuromuscular-Blocking Agents

Pharmacotherapy PearlsCisatracurium is classified as an intermediate-duration neuromuscular-blocking agent. It does not appear to have a cumulative effect on the duration of blockade. Neuromuscular-blocking potency is 3 times that of atracurium; maximum block is up to 2 minutes longer than for equipotent doses of atracurium.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConcurrent use with lithium may prolong neuromuscular blockade; conversely, neuromuscular blockade may be diminished if used with carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsCisatracurium is classified as an intermediate duration neuromuscular-blocking agent; does not appear to have a cumulative effect on the duration of blockade; neuromuscular-blocking potency is 3 times that of atracurium.

Critically-Ill Adult Patients:

The 2008 Surviving Sepsis Campaign guidelines recommend avoiding use of neuromuscular blockers if at all possible in the septic patient due to the risk of prolonged neuromuscular blockade following discontinuation. If one is required, monitor the depth of blockade (Grade 1B).

The 2002 ACCM/SCCM/ASHP clinical practice guidelines for sustained neuromuscular blockade in the adult critically-ill patient recommend:

Optimize sedatives and analgesics prior to initiation and monitor and adjust accordingly during course. Neuromuscular blockers do not relieve pain or produce sedation.

Protect patient's eyes from development of keratitis and corneal abrasion by administering ophthalmic ointment and taping eyelids closed or using eye patches. Reposition patient routinely to protect pressure points from breakdown. Address DVT prophylaxis.

Concurrent use of a neuromuscular blocker and corticosteroids appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible. Reassess need for neuromuscular blocker daily.

Using daily drug holidays (stopping neuromuscular-blocking agent until patient requires it again) may decrease the incidence of acute quadriplegic myopathy syndrome.

Tachyphylaxis can develop; switch to another neuromuscular blocker (taking into consideration the patient's organ function) if paralysis is still necessary.

Acidosis and severe hypothermia may delay the elimination of atracurium and cisatracurium.

Atracurium or cisatracurium is recommended for patients with significant hepatic or renal disease, due to organ-independent Hofmann elimination.

Monitor patients clinically and via “Train of Four” (TOF) testing with a goal of adjusting the degree of blockade to 1-2 twitches or based upon the patient's clinical condition.

Index TermsCisatracurium Besylate

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Cycle 1:

Cetuximab: I.V.: 400 mg/m^2 (loading dose) day 1 (week 1, cycle 1 only)

[total loading dose = 400 mg/m^2]

followed by I.V.: 250 mg/m^2/day days 8, 15, and 22

[total dose/cycle 1 = 1150 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Treatment cycle is 4 weeks

Subsequent cycles:

Cetuximab: I.V.: 250 mg/m^2/day days 1, 8, 15, and 22

[total dose/cycle = 1000 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 1

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 4 weeks

Variation 2:

Cycle 1:

Cetuximab: I.V.: 400 mg/m^2 (loading dose) day 1 (week 1, cycle 1 only)

[total loading dose = 400 mg/m^2]

followed by I.V.: 250 mg/m^2/day days 8 and 15

[total dose/cycle 1 = 900 mg/m^2]

Cisplatin: I.V.: 75-100 mg/m^2 day 1

[total dose/cycle = 75-100 mg/m^2]

Treatment cycle is 3 weeks

Subsequent cycles:

Cetuximab: I.V.: 250 mg/m^2/day days 1, 8, and 15

[total dose/cycle = 750 mg/m^2]

Cisplatin: I.V.: 75-100 mg/m^2 day 1

[total dose/cycle = 75-100 mg/m^2]

Repeat cycle every 3 weeks

  - [total dose/cycle = 5000 mg/m^2]
- Repeat cycle every 28 days

Variation 2:

- Cycles 1 to 3 (prior to surgery):
  - Cisplatin: I.V.: 100 mg/m^2/dose day 1
    - [total dose/cycle = 100 mg/m^2]
  - Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 5
    - [total dose/cycle = 5000 mg/m^2]
  - Treatment cycles 1-3 are 28 days each
- Cycles 4 and 5 (postoperative):
  - Cisplatin: I.V.: 75 mg/m^2/dose day 1
    - [total dose/cycle = 75 mg/m^2]
  - Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 5
    - [total dose/cycle = 5000 mg/m^2]
  - Treatment cycles 4 and 5 are 28 days each

Variation 3 (in combination with radiation therapy):

- Cycle 1:
  - Cisplatin: I.V.: 75 mg/m^2/dose day 1
    - [total dose/cycle = 75 mg/m^2]
  - Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4
    - [total dose/cycle = 4000 mg/m^2]
  - Treatment cycle is 28 days
- Cycles 2 to 4:
  - Cisplatin: I.V.: 75 mg/m^2/dose day 1
    - [total dose/cycle = 75 mg/m^2]
  - Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4
    - [total dose/cycle = 4000 mg/m^2]
  - Repeat cycle every 21 days for 3 more cycles (total of 4 cycles)

Variation 4 (in combination with radiation therapy):

- Cisplatin: I.V.: 100 mg/m^2/dose day 1
  - [total dose/cycle = 100 mg/m^2]
- Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4
  - [total dose/cycle = 4000 mg/m^2]
- Repeat cycle every 28 days for total of 2 cycles

Variation 5 (in combination with radiation therapy):

- Cisplatin: I.V.: 75 mg/m^2/dose day 1
  - [total dose/cycle = 75 mg/m^2]
- Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4
  - [total dose/cycle = 4000 mg/m^2]
- Repeat cycle every 28 days for 4 cycles

Variation 6 (in combination with radiation therapy):

- Cycles 1 and 2:
  - Cisplatin: I.V.: 75 mg/m^2/dose day 1
    - [total dose/cycle = 75 mg/m^2]
  - Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4
    - [total dose/cycle = 4000 mg/m^2]
  - Treatment cycles 1 and 2 are 28 days each; cycle 2 is followed by a 2-week rest
- Cycles 3 and 4 (begin cycle 3 at week 11):
  - Cisplatin: I.V.: 75 mg/m^2/dose day 1
    - [total dose/cycle = 75 mg/m^2]
  - Fluorouracil: I.V.: 1000 mg/m^2/day continuous infusion days 1 to 4
    - [total dose/cycle = 4000 mg/m^2]
  - Treatment cycles 3 and 4 are 28 days each

Variation 7 (in combination with radiation therapy):

- Cycles 1 to 4:
  - Cisplatin: I.V.: 15 mg/m^2/day days 1 to 5
    - [total dose/cycle = 75 mg/m^2]
  - Fluorouracil: I.V.: 800 mg/m^2/day continuous infusion days 1 to 5
    - [total dose/cycle = 4000 mg/m^2]
  - Repeat cycles 1-4 every 21 days; cycle 4 is followed by a 1-week rest
- Cycles 5 (begin cycle 5 at week 14):
  - Cisplatin: I.V.: 15 mg/m^2/day days 1 to 5
    - [total dose/cycle = 75 mg/m^2]
  - Fluorouracil: I.V.: 800 mg/m^2/day continuous infusion days 1 to 5
    - [total dose/cycle = 4000 mg/m^2]

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

CISplatin may be confused with CARBOplatin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Doses >100 mg/m^2 once every 3-4 weeks are rarely used and should be verified with the prescriber.

Pronunciation(SIS pla tin)

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent; Antineoplastic Agent, Platinum Analog

Use: Labeled IndicationsTreatment of bladder, testicular, and ovarian cancer

Use: Unlabeled/InvestigationalTreatment of head and neck, breast, gastric, lung, esophageal, cervical, prostate and small cell lung cancer; Hodgkin's and non-Hodgkin's lymphoma; neuroblastoma; sarcomas, myeloma, melanoma, mesothelioma, and osteosarcoma

Dosing: Adults

Advanced bladder cancer: 50-70 mg/m^2 every 3-4 weeks

Head and neck cancer (unlabeled use): 100-120 mg/m^2 every 3-4 weeks

Malignant pleural mesothelioma in combination with pemetrexed: 75 mg/m^2 on day 1 of each 21-day cycle; see Pemetrexed monograph for additional details

Metastatic ovarian cancer: 75-100 mg/m^2 every 3-4 weeks

Intraperitoneal: Cisplatin has been administered intraperitoneal with systemic sodium thiosulfate for ovarian cancer; doses up to 90-270 mg/m^2 have been administered and retained for 4 hours before draining

Testicular cancer: 10-20 mg/m^2/day for 5 days repeated every 3-4 weeks

High dose BMT: Continuous I.V.: 55 mg/m^2/24 hours for 72 hours; total dose: 165 mg/m^2

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. **VERIFY ANY CISPLATIN DOSE EXCEEDING 100 mg/m^2 PER COURSE.**

Unlabeled pediatric uses:

Intermittent dosing schedule: 37-75 mg/m^2 once every 2-3 weeks or 50-100 mg/m^2 over 4-6 hours, once every 21-28 days

Daily dosing schedule: 15-20 mg/m^2/day for 5 days every 3-4 weeks

Osteogenic sarcoma or neuroblastoma: 60-100 mg/m^2 on day 1 every 3-4 weeks

Recurrent brain tumors: 60 mg/m^2 once daily for 2 consecutive days every 3-4 weeks

Bone marrow/blood cell transfusion: Continuous Infusion: High dose: 55 mg/m^2/day for 72 hours; total dose = 165 mg/m^2

Dosing: Renal Impairment**Note:** The manufacturer(s) recommend that repeat courses of cisplatin should not be given until serum creatinine is <1.5 mg/dL and/or BUN is <25 mg/dL. The FDA-approved labeling does not contain renal dosing adjustment guidelines. The following guidelines have been used by some clinicians:

Aronoff, 2007:

Cl_{cr} 10-50 mL/minute: Administer 75% of dose

Cl_{cr} <10 mL/minute: Administer 50% of dose

Hemodialysis: Partially cleared by hemodialysis.

Administer 50% of dose posthemodialysis

Continuous ambulatory peritoneal dialysis (CAPD): Administer 50% of dose

Continuous renal replacement therapy (CRRT): Administer 75% of dose

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 75% of dose

Cl_{cr} 31-45 mL/minute: Administer 50% of dose

Cl_{cr} <30 mL/minute: Consider use of alternative drug

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Irritant. Perform pretreatment hydration (see Dosage).

I.V.: Rate of administration has varied from a 15- to 120-minute infusion, 1 mg/minute infusion, 6- to 8-hour infusion, 24-hour infusion, or per protocol. Maximum rate of infusion: 1 mg/minute in patients with CHF.

Administration: I.V. DetailpH: 3.5-5.5 (reconstituted solution); 3.7-6.0 (aqueous injection)

Dietary ConsiderationsSodium content: 9 mg/mL (equivalent to 0.9% sodium chloride solution)

StorageStore intact vials at room temperature 15°C to 25°C (59°F to 77°F) and protect from light. Do not refrigerate solution as a precipitate may form. Further dilution **stability is dependent on the chloride ion concentration** and should be mixed in solutions of NS (at least 0.3% NaCl). After initial entry into the vial, solution is stable for 28 days protected from light or for at least 7 days under fluorescent room light at room temperature.

Further dilutions in NS, D$_5$/0.45% NaCl or D$_5$/NS to a concentration of 0.05-2 mg/mL are stable for 72 hours at 4°C to 25°C. The infusion solution should have a final sodium chloride concentration ≥0.2%.

ReconstitutionThe infusion solution should have a final sodium chloride concentration ≥0.2%.

CompatibilityStable in D$_5$^{1}/$_4$NS, D$_5$^{1}/$_2$NS, D$_5$NS, ^{1}/$_4$NS, ^{1}/$_3$NS, ^{1}/$_2$NS, NS; **incompatible** with sodium bicarbonate; **variable stability (consult detailed reference)** in D$_5$W.

Y-site administration: Compatible: Allopurinol, aztreonam, bleomycin, chlorpromazine, cimetidine, cladribine, cyclophosphamide, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxorubicin liposome, droperidol, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, gatifloxacin, gemcitabine, granisetron, heparin, hydromorphone, leucovorin, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone sodium succinate, metoclopramide, mitomycin, morphine, ondansetron, paclitaxel, prochlorperazine edisylate, promethazine, propofol, ranitidine, sargramostim, teniposide, topotecan, vinblastine, vincristine, vinorelbine. **Incompatible:** Amifostine, amphotericin B cholesteryl sulfate complex, cefepime, piperacillin/tazobactam, thiotepa.

Compatibility in syringe: Compatible: Bleomycin, cyclophosphamide, doxapram, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.

Compatibility when admixed: Compatible: Carboplatin, cyclophosphamide with etoposide, etoposide, etoposide with floxuridine, floxuridine, floxuridine with leucovorin, hydroxyzine, ifosfamide, ifosfamide with etoposide, leucovorin, magnesium sulfate, mannitol, ondansetron. **Incompatible:** Fluorouracil, mesna, thiotepa. **Variable (consult detailed reference):** Etoposide with mannitol and potassium chloride, paclitaxel.

ContraindicationsHypersensitivity to cisplatin, other platinum-containing compounds, or any component of the formulation (anaphylactic-like reactions have been reported); pre-existing renal insufficiency; myelosuppression; hearing impairment; pregnancy

Allergy Considerations

- Platinum Derivative Allergy

Warnings/Precautions

Boxed warnings:

- Anaphylaxis: See "Concerns related to adverse effects" below.
- Experienced physician: See "Other warnings/precautions" below.
- Medication safety (usual maximum dose per cycle): See "Other warnings/precautions" below.
- Ototoxicity: See "Concerns related to adverse effects" below.
- Renal toxicity: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Anaphylaxis: **[U.S. Boxed Warnings]: Anaphylactic-like reactions have been reported; may be managed with epinephrine, corticosteroids, and/or antihistamines.**
- Dose-related toxicities: Myelosuppression, nausea, and vomiting are dose-related toxicities with use.
- Neuropathy: Severe and possibly irreversible neuropathies may occur with higher than recommended doses or more frequent regimen.
- Ototoxicity: **[U.S. Boxed Warnings]: Ototoxicity, especially pronounced in children, is manifested by tinnitus or loss of high frequency hearing and occasionally, deafness.**
- Renal toxicity: **[U.S. Boxed Warning]: Cumulative renal toxicity may be severe.**

Disease-related concerns:

- Renal impairment: Reduce dosage in renal impairment.

Concurrent drug therapy issues:

- Taxane derivatives: When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before platinum derivatives (carboplatin, cisplatin).

Special populations:

- Elderly: Select dose cautiously and monitor closely in the elderly; may be more susceptible to nephrotoxicity and peripheral neuropathy.

Other warnings/precautions:

- Medication safety (usual maximum dose per cycle): **[U.S. Boxed Warning]: Doses >100 mg/m^2 once every 3-4 weeks are rarely used and should be verified with the prescriber.**
- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- Hydration: Patients should receive adequate hydration, with or without diuretics, prior to and for 24 hours after administration; serum electrolytes, particularly magnesium and potassium, should be monitored and replaced as needed during and after therapy.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and embryotoxicity. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy. If used in pregnancy, or if patient becomes pregnant during treatment, the patient should be apprised of potential hazard to the fetus.

LactationEnters breast milk/contraindicated

Adverse Reactions

>10%:

Central nervous system: Neurotoxicity: Peripheral neuropathy is dose- and duration-dependent.

Dermatologic: Mild alopecia

Gastrointestinal: Nausea and vomiting (76% to 100%)

Hematologic: Myelosuppression (25% to 30%; mild with moderate doses, mild to moderate with high-dose therapy)

WBC: Mild

Platelets: Mild

Onset: 10 days

Nadir: 14-23 days

Recovery: 21-39 days

Hepatic: Liver enzymes increased

Renal: Nephrotoxicity (acute renal failure and chronic renal insufficiency)

Otic: Ototoxicity (10% to 30%; manifested as high frequency hearing loss; ototoxicity is especially pronounced in children)

1% to 10%:

Gastrointestinal: Diarrhea

Local: Tissue irritation

<1%: Anaphylactic reaction, arrhythmias, blurred vision, bradycardia, hemolytic uremic syndrome, mild alopecia, mouth sores, optic neuritis, orthostatic hypotension, papilledema, phlebitis, SIADH, thrombophlebitis

Oncology: VesicantNo

Oncology: Emetic PotentialHigh (>90%)

Oncology: Bone Marrow - Unique Toxicity

Central nervous system: Autonomic neuropathy, ototoxicity

Gastrointestinal: Highly emetogenic

Hematologic: Myelosuppression

Endocrine & metabolic: Hypokalemia, hypomagnesemia

Neuromuscular & skeletal: Peripheral neuropathy

Ocular: Optic neuropathy, retinal vascular occlusion and myelopathy (concurrent administration of high-dose carmustine)

Renal: Acute renal failure, serum creatinine increased, azotemia

Miscellaneous: Transient pain at tumor, transient autoimmune disorders

Drug Interactions

Aminoglycosides: CISplatin may enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Taxane Derivatives: Platinum Derivatives may enhance the myelosuppressive effect of Taxane Derivatives. Administer Taxane derivative before Platinum derivative when given as sequential infusions to limit toxicity. *Risk D: Consider therapy modification*

Topotecan: Platinum Derivatives may enhance the adverse/toxic effect of Topotecan. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vinorelbine: CISplatin may enhance the adverse/toxic effect of Vinorelbine. Specifically, the combination may be associated with a higher risk of granulocytopenia. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors.

Monitoring ParametersRenal function (serum creatinine, BUN, Cl_{cr}); electrolytes (particularly magnesium, calcium, potassium) before and within 48 hours after cisplatin therapy; audiography (baseline and prior to each subsequent dose), neurologic exam (with high dose); liver function tests periodically, CBC with differential and platelet count; urine output, urinalysis

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions (especially anything that is ototoxic or nephrotoxic). Patient should be vigorously hydrated prior to and for 24 hours following infusion. Cisplatin is highly emetogenic; antiemetic should be administered prior to each treatment and as needed between infusions. Infusion site must be monitored closely to reduce potential for extravasation. Assess results of laboratory tests and auditory status prior to each treatment and regularly during therapy. Patient response should be closely monitored during and following therapy (eg, acute or chronic renal failure; peripheral neuropathy and ototoxicity, may be irreversible). Teach patient (or caregiver) possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.

Monitoring: Lab TestsRenal function (serum creatinine, BUN, Cl_{cr}); electrolytes (particularly magnesium, calcium, potassium) before and within 48 hours after cisplatin therapy; liver function periodically, CBC with differential and platelet count, urinalysis

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by I.V. and numerous side-effects can occur. Report immediately any burning, pain, itching, or redness at infusion site. It is important that you maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and adequate nutrition (small, frequent meals may help). May cause severe nausea or vomiting that can be delayed for up to 48 hours after infusion and last for 1 week (consult prescriber for appropriate antiemetic medication); mouth sores (use soft toothbrush or cotton swabs for mouth care); or loss of hair (reversible). You will be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). Report promptly any pain, tingling, loss of sensation or cramping in extremities; change in hearing; difficulty breathing or swallowing; fever or chills; unusual fatigue; unusual bruising/bleeding; or any other unusual symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 1 mg/mL (50 mL, 100 mL, 200 mL)

Generic AvailableYes

Mechanism of ActionInhibits DNA synthesis by the formation of DNA cross-links; denatures the double helix; covalently binds to DNA bases and disrupts DNA function; may also bind to proteins; the *cis*-isomer is 14 times more cytotoxic than the *trans*-isomer; both forms cross-link DNA but cis-platinum is less easily recognized by cell enzymes and, therefore, not repaired. Cisplatin can also bind two adjacent guanines on the same strand of DNA producing intrastrand cross-linking and breakage.

Pharmacodynamics/Kinetics

Distribution: I.V.: Rapidly into tissue; high concentrations in kidneys, liver, ovaries, uterus, and lungs

Protein binding: >90%

Metabolism: Nonenzymatic; inactivated (in both cell and bloodstream) by sulfhydryl groups; covalently binds to glutathione and thiosulfate

Half-life elimination: Initial: 20-30 minutes; Beta: 60 minutes; Terminal: ~24 hours; Secondary half-life: 44-73 hours

Excretion: Urine (>90%); feces (10%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other Considerations

Nephrotoxicity: Related to elimination, protein binding, and uptake of cisplatin. Two types of nephrotoxicity: Acute renal failure and chronic renal insufficiency.

Acute renal failure and azotemia is a dose-dependent process and can be minimized with proper administration and prophylaxis. Damage to the proximal tubules by unbound cisplatin is suspected to cause the toxicity. It is manifested as increased BUN/creatinine, oliguria, protein wasting, and potassium, calcium, and magnesium wasting.

Chronic renal dysfunction can develop in patients receiving multiple courses of cisplatin. Slow release of tissue-bound cisplatin may contribute to chronic nephrotoxicity. Manifestations of this toxicity are varied, and can include sodium and water wasting, nephropathy, hyperuricemia, decreased Cl_{cr}, and magnesium wasting.

Recommendations for minimizing nephrotoxicity include:

Prepare cisplatin in saline-containing vehicles.

Infuse dose over 24 hours.

Vigorously hydrate patient (125-150 mL/hour) before, during, and after cisplatin administration.

Simultaneously administer either mannitol or furosemide.

Pretreat with amifostine.

Avoid other nephrotoxic agents (aminoglycosides, amphotericin, etc).

Neurotoxicity: Peripheral neuropathy is dose- and duration-dependent. The mechanism is through axonal degeneration with subsequent damage to the long sensory nerves. Toxicity can first be noted at cumulative doses of 200 mg/m^2, with measurable toxicity at cumulative doses >350 mg/m^2. This process is irreversible and progressive with continued therapy.

Anaphylactic Reaction: Occurs within minutes after intravenous or intraperitoneal administration; can be controlled with epinephrine, antihistamines, and steroids.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Celexa® may be confused with Celebrex®, Cerebra®, Cerebyx®, Ranexa™, Zyprexa®

Pronunciation(sye TAL oh pram)

U.S. Brand NamesCelexa®

Canadian Brand NamesApo-Citalopram®; Celexa®; Citalopram-ODAN; CO Citalopram; CTP 30; Dom-Citalopram; Gen-Citalopram; IPG-Citalopram; JAMP-Citalopram; Mint-Citalopram; Novo-Citalopram; PHL-Citalopram; PMS-Citalopram; RAN™-Citalopram; ratio-Citalopram; Riva-Citalopram; Sandoz-Citalopram

Pharmacologic CategoryAntidepressant, Selective Serotonin Reuptake Inhibitor

Use: Labeled IndicationsTreatment of depression

Use: Unlabeled/InvestigationalTreatment of mild dementia-associated agitation in nonpsychotic patients; smoking cessation; ethanol abuse; obsessive-compulsive disorder (OCD) in children; diabetic neuropathy

Dosing: AdultsDepression: Oral: Initial: 20 mg/day, generally with an increase to 40 mg/day; doses of more than 40 mg are not usually necessary. Should a dose increase be necessary, it should occur in 20 mg increments at intervals of no less than 1 week. Maximum dose: 60 mg/day.

Dosing: Elderly

Depression: Oral: Initial: 20 mg once daily; increase dose to 40 mg/day in nonresponsive patients

Alzheimer's dementia-related depression (unlabeled use): Oral: Initial: 5-10 mg/day; may increase at multi-week intervals to maximum of 40 mg/day

Dosing: PediatricChildren and Adolescents: Obsessive-compulsive disorder (unlabeled use): Oral: 10-40 mg/day

Dosing: Renal Impairment

Mild-to-moderate impairment: No dosage adjustment needed.

Severe impairment: Cl_{cr} <20 mL/minute: Use with caution.

Dosing: Hepatic ImpairmentOral: 20 mg once daily; increase dose to 40 mg/day in nonresponsive patients.

Dietary ConsiderationsMay be taken without regard to food.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to citalopram or any component of the formulation; concomitant use with MAO inhibitors or within 2 weeks of discontinuing MAO inhibitors; concomitant use with pimozide

Allergy Considerations

- Selective Serotonin Reuptake Inhibitor (SSRI) Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See "Major psychiatric warnings" below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Citalopram is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Citalopram is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: Relatively devoid of these side effects.

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin, NSAIDs, warfarin, or other anticoagulants. Bleeding (including GI bleeding) related to SSRI or SNRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly; reversible with discontinuation of treatment. Volume depletion and/or concurrent use of diuretics likely increases risk.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Renal impairment: Use with caution in patients with severe renal impairment.

Concurrent drug therapy issues:

- Anticoagulants/Antiplatelets: Use caution with concomitant use of aspirin, NSAIDs, warfarin, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- CNS depressants: Use caution with concomitant therapy.

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur.

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce citalopram's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Elderly: Use caution in elderly patients; risk of hyponatremia and other adverse events may be increased.

- Pediatrics: Safety and efficacy in children have not been established.

- Pregnancy: Use caution in pregnant patients; high doses of citalopram have been associated with teratogenicity in animals.

Other warnings/precautions:

- Electroconvulsive therapy (ECT): Use with caution; no clinical studies have assessed the combined use of citalopram and electroconvulsive therapy; may increase the risks (eg, cognitive adverse effects) associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of citalopram therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsIn open-label and placebo-controlled studies, elderly patients with or without dementia have shown significant improvement in depressive symptoms, irritability, anxiety, behavior, and restlessness. Effects on intellectual function have not been consistent. Thus, it appears that citalopram has additional effects in stabilizing emotion. A seven- to eightfold variation in citalopram S(+) (active) and R(-) enantiomer concentrations have been reported in the elderly. The racemic citalopram concentration-to-dose ratio was 1.8 times greater in elderly patients compared to younger patients.

Clearance was decreased, while AUC and half-life were significantly increased in elderly patients and in patients with hepatic impairment. Mild to moderate renal impairment may reduce clearance of citalopram (17% reduction noted in trials). No pharmacokinetic information is available concerning patients with severe renal impairment. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDue to adverse effects observed in animal studies, citalopram is classified as pregnancy category C. Citalopram and its metabolites cross the human placenta. Nonteratogenic effects in the newborn following SSRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypo- or hypertonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. An increased risk of low birth weight and lower APGAR scores have also been reported. Exposure to SSRIs after the twentieth week of gestation has been associated with persistent pulmonary hypertension of the newborn (PPHN). Adverse effects may be due to toxic effects of the SSRI or drug withdrawal without a taper. The long term effects of *in utero* SSRI exposure on infant development and behavior are not known.

Due to pregnancy-induced physiologic changes, women who are pregnant may require increased doses of citalopram to achieve euthymia. Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician (ACOG, 2007). If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationEnters breast milk/consider risk:benefit

Breast-Feeding ConsiderationsCitalopram and its metabolites are excreted in human milk. According to the manufacturer, the decision to continue or discontinue breast-feeding during therapy should take into account the risk of exposure to the infant and the benefits of treatment to the mother. Excessive somnolence, decreased feeding, colic, irritability, restlessness, and weight loss have been reported in breast-fed infants. The long-term effects on development and behavior have not been studied; therefore, citalopram should be prescribed to a mother who is breast-feeding only when the benefits outweigh the potential risks.

Adverse Reactions

>10%:

Central nervous system: Somnolence (18%; dose related), insomnia (15%; dose related)

Gastrointestinal: Nausea (21%), xerostomia (20%)

Miscellaneous: Diaphoresis (11%; dose related)

1% to 10%:

Cardiovascular: Heart rate decreased, postural hypotension, tachycardia

Central nervous system: Fatigue (5%; dose related), anorexia (4%), anxiety (4%), agitation (3%), fever (2%), yawning (2%; dose related), amnesia, apathy, concentration impaired, confusion, depression, migraine, suicide attempt

Dermatologic: Rash, pruritus

Endocrine & metabolic: Libido decreased (1% to 4%), dysmenorrhea (3%), amenorrhea, sexual dysfunction

Gastrointestinal: Diarrhea (8%), dyspepsia (5%), vomiting (4%), abdominal pain (3%), flatulence, salivation increased, taste perversion, weight gain/loss

Genitourinary: Ejaculation disorder (6%), impotence (3%; dose related), polyuria

Neuromuscular & skeletal: Tremor (8%), arthralgia (2%), myalgia (2%), paresthesia

Ocular: Abnormal accommodation

Respiratory: Rhinitis (5%), upper respiratory tract infection (5%), sinusitis (3%), cough

<1% (Limited to important or life threatening): Aggressiveness, alkaline phosphatase increased, alopecia, anemia, angina pectoris, ataxia, cardiac failure, cerebral vascular accident, dyspnea, dystonia, eczema, edema (extremities), epistaxis, extrapyramidal symptoms, extrasystoles, hallucinations, hypertension, leukocytosis, leukopenia, liver enzymes increased, lymphadenopathy, muscle weakness, myocardial infarction, neuralgia, photosensitivity, purpura, rigors, tinnitus, urinary incontinence, urinary retention, urticaria

Postmarketing and/or case reports: Acute renal failure, akathisia, allergic reaction, anaphylaxis, angioedema, choreoathetosis, chest pain, delirium, dyskinesia, ecchymosis, epidermal necrolysis, erythema multiforme, gastrointestinal hemorrhage, glaucoma, grand mal seizure, hemolytic anemia, hepatic necrosis, hyponatremia, myoclonus, neuroleptic malignant syndrome, nystagmus, pancreatitis, priapism, prolactinemia, prothrombin decreased, QT prolonged, rhabdomyolysis, serotonin syndrome, SIADH, spontaneous abortion, thrombocytopenia, thrombosis, ventricular arrhythmia, torsade de pointes, withdrawal syndrome

Metabolism/Transport Effects**Substrate** of CYP2C19 (major), 2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C19 (weak), 2D6 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Blockers: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Alpha-/Beta-Blockers. *Risk C: Monitor therapy*

Analgesics (Opioid): May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): Selective Serotonin Reuptake Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Aspirin: Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Beta-Blockers: Selective Serotonin Reuptake Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Acebutolol; Atenolol; Carteolol; Esmolol; Levobunolol; Metipranolol; Nadolol; Penbutolol. *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

CarBAMazepine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Clozapine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Cyproheptadine: May diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dextromethorphan: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Dextromethorphan. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Haloperidol: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Selective Serotonin Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methadone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Mexiletine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Mexiletine. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

NSAID (Nonselective): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Phenytoin: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimozide: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Propafenone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Risperidone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Risperidone. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: Selective Serotonin Reuptake Inhibitors may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tryptophan: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Selective Serotonin Reuptake Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava, and gotu kola (may increase CNS depression).

Monitoring ParametersMonitor patient periodically for symptom resolution; mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; akathisia

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for possible interaction (especially MAO inhibitors, P450 inhibitors, and other CNS active agents). Monitor for effectiveness of therapy and adverse reactions. Assess mental status for depression, suicidal ideation, anxiety, social functioning, mania, or panic attack. Assess knowledge/teach patient appropriate use, interventions to reduce side effects (eg, hypotensive precautions), and adverse symptoms to report.

Monitoring: Lab TestsLiver function tests and CBC with continued therapy

Patient EducationIt may take up to 3 weeks to see therapeutic effects from this medication. Take as directed; do not alter dose or frequency without consulting prescriber. May be taken with or without food. Avoid alcohol, caffeine, and CNS stimulants. Avoid use of aspirin or other NSAIDs unless approved by prescriber (may increase risk of bleeding). You may experience sexual dysfunction (reversible). May cause dizziness, anxiety, or blurred vision (rise slowly from sitting or lying position and use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report confusion or impaired concentration, thoughts of suicide, severe headache, palpitations, rash, insomnia or nightmares, changes in personality, muscle weakness or tremors, altered gait pattern, signs and symptoms of respiratory infection, or excessive perspiration. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral: 10 mg/5 mL (240 mL)

Celexa®: 10 mg/5 mL (240 mL) [alcohol free, sugar free; contains propylene glycol; peppermint flavor]

Tablet: 10 mg, 20 mg, 40 mg

Celexa®: 10 mg, 20 mg, 40 mg

Generic AvailableYes

ManufacturerForest Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Citalopram Hydrobromide)

10 mg/5 mL (240): $114.00

Tablets (Celexa)

10 mg (30): $95.21

20 mg (30): $96.99

40 mg (30): $103.67

Tablets (Citalopram Hydrobromide)

10 mg (30): $39.99

20 mg (30): $39.99

40 mg (30): $26.99

Mechanism of Action A racemic bicyclic phthalane derivative, citalopram selectively inhibits serotonin reuptake in the presynaptic neurons and has minimal effects on norepinephrine or dopamine. Uptake inhibition of serotonin is primarily due to the *S*-enantiomer of citalopram. Displays little to no affinity for serotonin, dopamine, adrenergic, histamine, GABA, or muscarinic receptor subtypes.

Pharmacodynamics/Kinetics

Onset of action: Depression: The onset of action is within a week, however, individual response varies greatly and full response may not be seen until 8-12 weeks after initiation of treatment.

Distribution: V_d: 12 L/kg

Protein binding, plasma: ~80%

Metabolism: Extensively hepatic, via CYP3A4 and 2C19 (major pathways), and 2D6 (minor pathway); forms metabolites, N-demethylcitalopram (DCT) and didemethylcitalopram (DDCT) which are at least eight times less potent than citalopram

Bioavailability: 80%

Half-life elimination: 24-48 hours (average: 35 hours); doubled with hepatic impairment

Time to peak, serum: 1-6 hours, average within 4 hours

Excretion: Urine (Citalopram 10% and DCT 5%)

Note: Clearance was decreased, while AUC and half-life were significantly increased in elderly patients and in patients with hepatic impairment. Mild-to-moderate renal impairment may reduce clearance (17%) and prolong half-life of citalopram. No pharmacokinetic information is available concerning patients with severe renal impairment.

- Selective Serotonin Reuptake Inhibitors (SSRIs) CYP Profile
- Selective Serotonin Reuptake Inhibitors (SSRIs) FDA-Approved Indications
- Selective Serotonin Reuptake Inhibitors (SSRIs) Pharmacokinetics
- Selective Serotonin Reuptake Inhibitors (SSRIs) Receptor Profile
- Teratogenic Risks of Psychotropic Medications

Dental Health Professional Considerations Problems with SSRI-induced bruxism have been reported and may preclude their use; clinicians attempting to evaluate any patient with bruxism or involuntary muscle movement, who is simultaneously being treated with an SSRI drug, should be aware of the potential association.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Premarketing trials reported abnormal taste. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Although caution should be used in patients taking tricyclic antidepressants, no interactions have been reported with vasoconstrictors and citalopram, a nontricyclic antidepressant which acts to increase serotonin; no precautions appear to be needed

Mental Health: Child/Adolescent Considerations Twenty-three patients with OCD (9-18 years of age) received 10-40 mg/day (40 mg modal) (Thomsen, 1997).

Thomsen PH, “Child and Adolescent Obsessive-Compulsive Disorder Treated With Citalopram: Findings From an Open Trial of 23 Cases,” *J Child Adolesc Psychopharmacol*, 1997, 7(3):157-66.

Wagner KD, Robb AS, Findling RL, et al, "A Randomized, Placebo-Controlled Trial of Citalopram for the Treatment of Major Depression in Children and Adolescents," *Am J Psychiatry*, 2004, 161(6):1079-83.

Mental Health Comment The SSRIs as a class are generally considered to be safe and equally effective. Allow sufficient dose-response time (6-12 weeks). Differences lie in approved indications, receptor profiles, pharmacokinetics, and cytochrome P450 activity profile. Subtle differences exist in adverse effect profiles. All SSRIs have the potential to cause sexual dysfunction. Among the SSRIs, citalopram possesses a mild effect on CYP isoenzymes.

Index Terms Citalopram Hydrobromide; Nitalapram

Medication Safety Issues

Sound-alike/look-alike issues:

Renacidin® may be confused with Remicade®

Pronunciation(SI trik AS id, mag NEE see um KAR bo nate, and GLOO kon o DEL ta LAK tone)

U.S. Brand NamesRenacidin®

Pharmacologic CategoryGenitourinary Irrigant; Urinary Tract Product

Use: Labeled IndicationsPrevention of formation of calcifications of indwelling urinary tract catheters; treatment of renal and bladder calculi of the apatite or struvite type

Dosing: Adults

Dissolution or prevention of calcifications: Irrigation (indwelling urethral catheters): 30-60 mL 2-3 times/day by means of a rubber syringe

Renal calculi: Irrigation: Infuse NS at 60 mL/hour and increase until pain, elevated pressure, or maximum flow rate of 120 mL/hour is reached. Begin flow of solution at maximum rate achieved with NS.

Bladder calculi: 30 mL instilled through urinary catheter; clamp for 30-60 minutes, then release and drain; repeat 4-6 times/day

Dosing: ElderlyRefer to adult dosing.

Administration: OtherDiscontinue irrigation immediately if pain or fever occurs. Maintain patency of irrigating catheter; discontinue if obstructed.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to any component of the formulation; urinary tract infection; treatment of calcium oxalate, uric acid, or cysteine calculi

Warnings/Precautions

Concerns related to adverse effects:

- Hypermagnesemia: Severe hypermagnesemia has occurred; monitor magnesium levels closely.

Disease-related concerns:

- Renal impairment: Use with caution in patients with impaired renal function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsMagnesium is excreted in human milk; it is not known if the combination of ingredients used by irrigation are excreted in breast milk.

Adverse Reactions

>10%:

Central nervous system: Fever (20% to 40%)

Genitourinary: Urothelial ulceration with or without edema (13%)

Miscellaneous: Transient flank pain

1% to 10%:

Endocrine & metabolic: Hypermagnesemia, hyperphosphatemia

Genitourinary: Urinary tract infection, dysuria, hematuria, bladder irritability

Neuromuscular & skeletal: Back pain

Renal: Creatinine increased

<1%: Septicemia, ileus, vomiting, thrombophlebitis

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Aluminum Hydroxide: Citric Acid Derivatives may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Fexofenadine: Antacids may decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Monitoring ParametersSerum creatinine, serum phosphate, serum magnesium; urine cultures
Monitoring: Lab TestsSerum creatinine, serum phosphate, serum magnesium; urine cultures
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, irrigation: Citric acid 6.602 g, magnesium carbonate 3.177 g, glucono-delta-lactone 0.198 g per 100 mL (500 mL) [contains benzoic acid]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Solution (Renacidin)

(500): $40.00

Mechanism of ActionMagnesium from the irrigating solution is exchanged for calcium in the stone matrix. The magnesium stones are soluble and are able to dissolve in the acidic pH of the solution.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsCitric Acid and d-gluconic Acid Irrigant; Citric Acid Bladder Mixture; Citric Acid, Magnesium Hydroxycarbonate, D-Gluconic Acid, Magnesium Acid Citrate, and Calcium Carbonate; Hemiacidrin

---

Citric Acid, Sodium Citrate, and Potassium Citrate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SIT rik AS id, SOW dee um SIT rate, & poe TASS ee um SIT rate)
U.S. Brand NamesCytra-3; Polycitra速; Polycitra速-LC; Tricitrates
Pharmacologic CategoryAlkalinizing Agent
Use: Labeled IndicationsConditions where long-term maintenance of an alkaline urine is desirable as in control and dissolution of uric acid and cystine calculi of the urinary tract
Dosing: AdultsAlkalinizing agent/bicarbonate precursor/potassium supplement: Oral: 15-30 mL diluted in water after meals and at bedtime
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAlkalinizing agent/bicarbonate precursor/potassium supplement: Oral: Children: 5-15 mL diluted in water after meals and at bedtime
Dietary ConsiderationsShould be taken after meals.
Warnings/PrecautionsConversion to bicarbonate may be impaired in patients with hepatic failure, in shock, or who are severely ill.
Pregnancy Risk FactorNot established
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac abnormalities

Endocrine & metabolic: Metabolic alkalosis, calcium levels, hyperkalemia, hypernatremia

Gastrointestinal: Diarrhea

Neuromuscular & skeletal: Tetany

Drug Interactions

ACE Inhibitors: Potassium Salts may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aluminum Hydroxide: Citric Acid Derivatives may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: Potassium Salts may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium Salts. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Potassium-Sparing Diuretics: Potassium Salts may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Cytra-3: Citric acid 334 mg, sodium citrate 500 mg, and potassium citrate 550 mg per 5 mL (480 mL) [equivalent to potassium 1 mEq, sodium 1 mEq, and bicarbonate 2 mEq per 1 mL; alcohol free, sugar free; contains sodium benzoate and propylene glycol; raspberry flavor]

Polycitra速-LC: Citric acid 334 mg, sodium citrate 500 mg, and potassium citrate 550 mg per 5 mL (480 mL) [equivalent to potassium 1 mEq, sodium 1 mEq, and bicaronate 2 mEq per 1 mL; alcohol free, sugar free]

Tricitrates: Citric acid 334 mg, sodium citrate 500 mg, and potassium citrate 550 mg per 5 mL (480 mL) [equivalent to potassium 1 mEq, sodium 1 mEq, and bicaronate 2 mEq per 1 mL; alcohol free; contains sodium benzoate; raspberry flavor]

Tricitrates: Citric acid 334 mg, sodium citrate 500 mg, and potassium citrate 550 mg per 5 mL (15 mL, 30 mL, 480 mL) [equivalent to potassium 1 mEq, sodium 1 mEq, and bicaronate 2 mEq per 1 mL; alcohol free, sugar free; contains sodiuim benzoate and propylene glycol; raspberry flavor]

Syrup, oral:

Polycitra速: Citric acid 334 mg, sodium citrate 500 mg, and potassium citrate 550 mg per 5 mL (480 mL) [equivalent to potassium 1 mEq, sodium 1 mEq and bicarbonate 2 mEq per 1 mL; alcohol free]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Solution (Polycitra-LC)

334-550-500 mg/5 mL (480): $37.01

Syrup (Polycitra)

334-550-500 mg/5 mL (473): $43.00

Syrup (Tricitrates)

334-550-500 mg/5 mL (480): $32.06

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentSodium chloride intake may decrease serum lithium levels; monitor

Mental Health CommentAlkalization of the urine may increase toxicity of amphetamine, ephedrine, and pseudoephedrine

Index TermsPotassium Citrate, Citric Acid, and Sodium Citrate; Sodium Citrate, Citric Acid, and Potassium Citrate

Cladribine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cladribine may be confused with cleVIDipine, clofarabine

Leustatin® may be confused with lovastatin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(KLA dri been)

U.S. Brand NamesLeustatin®

Canadian Brand NamesLeustatin®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite; Antineoplastic Agent, Antimetabolite (Purine Antagonist); Antineoplastic Agent, Antimetabolite (Purine)

Use: Labeled IndicationsTreatment of hairy cell leukemia

Use: Unlabeled/InvestigationalTreatment of chronic lymphocytic leukemia (CLL), chronic myelogenous leukemia (CML), non-Hodgkin's lymphomas, progressive multiple sclerosis

Dosing: AdultsRefer to individual protocols.

Hairy cell leukemia: I.V. Continuous infusion:

0.09 mg/kg/day days 1-7; may be repeated every 28-35 days **or**

3.4 mg/m^2/day SubQ days 1-7 (unlabeled dose)

Chronic lymphocytic leukemia (unlabeled use): I.V. Continuous infusion:

0.1 mg/kg/day days 1-7 **or**

0.028-0.14 mg/kg/day as a 2-hour infusion days 1-5

Chronic myelogenous leukemia (unlabeled use): I.V. 15 mg/m^2/day as a 1-hour infusion days 1-5; if no response, increase dose to 20 mg/m^2/day in the second course.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols.

Acute leukemias (unlabeled use): 6.2-7.5 mg/m^2/day continuous infusion for days 1-5; maximum tolerated dose was 8.9 mg/m^2/day.

Dosing: Renal ImpairmentThe FDA-approved labeling recommends that caution should be used in patients with renal impairment; however, no specific dosage adjustment guidelines are available due to lack of data. The following guidelines have been used by some clinicians (Aronoff, 2007):

Children:

Cl$_{cr}$ 10-50 mL/minute: Administer 50% of dose

Cl$_{cr}$ <10 mL/minute: Administer 30% of dose

Hemodialysis: Administer 30% of dose

Continuous renal replacement therapy (CRRT): Administer 50% of dose

Adults:

Cl$_{cr}$ 10-50 mL/minute: Administer 75% of dose

Cl$_{cr}$ <10 mL/minute: Administer 50% of dose

Continuous ambulatory peritoneal dialysis (CAPD): Administer 50% of dose

Dosing: Hepatic ImpairmentThe FDA-approved labeling recommends that caution should be used in patients with hepatic impairment;

however, no specific dosage adjustment guidelines are available due to lack of data.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Administer as a 1- to 2-hour infusion or by continuous infusion

Administration: I.V. DetailpH: 6-6.6

StorageStore intact vials under refrigeration 2°C to 8°C (36°F to 46°F). Protect from light. Dilutions in 500 mL NS are stable for 72 hours. Stable in PVC containers for 24 hours at room temperature of 15°C to 30°C (59°F to 86°F) and 7 days in Pharmacia Deltec® cassettes.

ReconstitutionDilute in 500 mL; dilute to a total volume of 100 mL for 7-day infusion. Solutions for 7-day infusion should be prepared in bacteriostatic NS; the manufacturer recommends filtering with a 0.22 micron filter when preparing 7-day infusions.

CompatibilityStable in NS; **incompatible** with D_5W.

Y-site administration: Compatible: Aminophylline, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, doxorubicin, droperidol, enalaprilat, etoposide, famotidine, furosemide, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, leucovorin, lorazepam, mannitol, meperidine, mesna, methylprednisolone sodium succinate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, paclitaxel, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, sodium bicarbonate, teniposide, vincristine.

ContraindicationsHypersensitivity to cladribine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Myelosuppression: See “Concerns related to adverse effects” below.
- Neurotoxicity: See “Concerns related to adverse effects” below.
- Renal toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Fever: May occur, with or without neutropenia.
- Myelosuppression: **[U.S. Boxed Warnings]: Dose-dependent, reversible myelosuppression will occur; use with caution in patients with pre-existing hematologic or immunologic abnormalities.**
- Neurotoxicity: **[U.S. Boxed Warning]: Neurologic toxicity has been reported, usually with higher doses, but may occur at normal doses.**
- Renal toxicity: **[U.S. Boxed Warning]: Acute renal toxicity has been reported with high doses; use caution when administering with other nephrotoxic agents.**
- Tumor lysis syndrome: With high tumor burden, tumor lysis syndrome and subsequent hyperuricemia may occur; consider allopurinol and hydrate accordingly.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects and fetal mortality were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: Fever (69%; ≥104ºF: 11%), fatigue (11% to 45%), headache (7% to 22%)

Dermatologic: Rash (10% to 27%)

Gastrointestinal: Nausea (28%), appetite decreased (17%), vomiting (13%)

Hematologic: Myelosuppression, common, dose limiting (nadir: 5-10 days, recovery: 4-8 weeks); neutropenia (70%); anemia (37%); thrombocytopenia (12%)

Local: Injection site reactions (9% to 19%)

Respiratory: Abnormal breath sounds (11%)

Miscellaneous: Infection (28%)

1% to 10%:

Cardiovascular: Edema (6%), tachycardia (6%), thrombosis (2%)

Central nervous system: Dizziness (9%), chills (9%), insomnia (7%), malaise (5% to 7%), pain (6%)

Dermatologic: Purpura (10%), petechiae (8%), pruritus (6%), erythema (6%)

Gastrointestinal: Diarrhea (10%), constipation (9%), abdominal pain (6%)

Local: Phlebitis (2%)

Neuromuscular & skeletal: Weakness (9%), myalgia (7%), arthralgia (5%)

Respiratory: Cough (7% to 10%), abnormal chest sounds (9%), dyspnea (7%), epistaxis (5%)

Miscellaneous: Diaphoresis (9%)

<1%, postmarketing and/or case reports: Aplastic anemia, bilirubin increased, hemolytic anemia, hypereosinophilia, myelodysplastic syndrome, neurologic toxicity, opportunistic infections, pancytopenia, paraparesis, pneumonia, polyneuropathy (with high doses), pulmonary interstitial infiltrates, quadriplegia (reported at high doses); renal dysfunction (with high doses), Stevens-Johnson syndrome, toxic epidermal necrolysis, transaminases increased, tumor lysis syndrome, urticaria

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).
Monitoring ParametersCBC with differential, renal and hepatic function; monitor for fever

Periodic assessment of peripheral blood counts, particularly during the first 4-8 weeks post-treatment, is recommended to detect the development of anemia, neutropenia, and thrombocytopenia and for early detection of any potential sequelae (eg, infection or bleeding)

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, myelosuppression, cardiac changes, renal failure) regularly during therapy and following therapy (patients should be considered immunosuppressed for up to 1 year after cladribine therapy). Teach patient (or caregiver) possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsLiver and renal function tests, CBC with differential, platelets, uric acid
Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. This drug can only be administered by infusion. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition during therapy (small, frequent meals may help). You will be more susceptible to infection during therapy and for up to 1 year following therapy (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); muscle weakness or pain (consult prescriber for mild analgesics); or mouth sores (use frequent mouth care with soft toothbrush or cotton swabs and frequent mouth rinses). Report immediately rash, unusual excessive fatigue, and/or signs of infection. Report rapid heartbeat or palpitations; unusual bruising or bleeding; persistent GI disturbances; diarrhea or constipation; yellowing of eyes or skin; change in color of urine or stool; swelling, warmth, or pain in extremities; or difficult respirations. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Do not breast-feed until prescriber advises it is safe.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 1 mg/mL (10 mL)

Generic AvailableYes
ManufacturerOrtho Biotech, Inc
Mechanism of ActionA purine nucleoside analogue; prodrug which is activated via phosphorylation by deoxycytidine kinase to a 5'-triphosphate derivative. This active form incorporates into DNA to result in the breakage of DNA strand and shutdown of DNA synthesis. This also results in a depletion of nicotinamide adenine dinucleotide and adenosine triphosphate (ATP). Cladribine is cell-cycle nonspecific.
Pharmacodynamics/Kinetics

Absorption: Oral: 55%; SubQ: 100%; Rectal: 20%

Distribution: V_d: 4.52 ± 2.82 L/kg

Protein binding: 20%

Metabolism: Hepatic; 5′-triphosphate moiety-active

Half-life elimination: Biphasic: Alpha: 25 minutes; Beta: 6.7 hours; Terminal, mean: Normal renal function: 5.4 hours

Excretion: Urine (18% to 44%)

Clearance: Estimated systemic: 640 mL/hour/kg

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, or insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine

Clarithromycin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Clarithromycin may be confused with Claritin®, clindamycin, erythromycin

Pronunciation(kla RITH roe mye sin)

U.S. Brand NamesBiaxin®; Biaxin® XL

Canadian Brand NamesApo-Clarithromycin; Biaxin®; Biaxin® XL; Gen-Clarithromycin; PMS-Clarithromycin; ratio-Clarithromycin; Sandoz-Clarithromycin

Pharmacologic CategoryAntibiotic, Macrolide

Use: Labeled Indications

Children:

Acute otitis media (*H. influenzae*, *M. catarrhalis*, or *S. pneumoniae*)

Community-acquired pneumonia due to susceptible *Mycoplasma pneumoniae*, *S. pneumoniae*, or *Chlamydia pneumoniae* (TWAR)

Pharyngitis/tonsillitis due to susceptible *S. pyogenes*, acute maxillary sinusitis due to susceptible *H. influenzae, S. pneumoniae,* or *Moraxella catarrhalis*, uncomplicated skin/skin structure infections due to susceptible *S. aureus, S. pyogenes,* and mycobacterial infections

Prevention of disseminated mycobacterial infections due to MAC disease in patients with advanced HIV infection

Adults:

Pharyngitis/tonsillitis due to susceptible *S. pyogenes*

Acute maxillary sinusitis and acute exacerbation of chronic bronchitis due to susceptible *H. influenzae*, *H. parainfluenzae*, *M. catarrhalis*, or *S. pneumoniae*

Community-acquired pneumonia due to susceptible *H. influenzae, H. parainfluenzae, Mycoplasma pneumoniae, S. pneumoniae,* or *Chlamydia pneumoniae* (TWAR), *Moraxella catarrhalis*

Uncomplicated skin/skin structure infections due to susceptible *S. aureus*, *S. pyogenes*

Disseminated mycobacterial infections due to *M. avium* or *M. intracellulare*

Prevention of disseminated mycobacterial infections due to *M. avium* complex (MAC) disease (eg, patients with advanced HIV infection)

Duodenal ulcer disease due to *H. pylori* in regimens with other drugs including amoxicillin and lansoprazole or omeprazole, ranitidine bismuth citrate, bismuth subsalicylate, tetracycline, and/or an H_2 antagonist

Use: Unlabeled/InvestigationalPertussis (CDC guidelines); alternate antibiotic for prophylaxis of infective endocarditis in patients who are allergic to penicillin and undergoing surgical or dental procedures (ACC/AHA guidelines)

Use: DentalAlternate oral antibiotic for prevention of infective endocarditis in individuals allergic to penicillins or ampicillin, when amoxicillin cannot be used; alternate antibiotic in the treatment of common orofacial infections caused by aerobic gram-positive cocci and susceptible anaerobes

Dosing: Adults

Usual dosage range: Oral: 250-500 mg every 12 hours **or** 1000 mg (two 500 mg extended release tablets) once daily for 7-14 days

Acute exacerbation of chronic bronchitis: Oral:

M. catarrhalis and *S. pneumoniae*: 250 mg every 12 hours for 7-14 days **or** 1000 mg (two 500 mg extended release tablets) once daily for 7 days

H. influenzae: 500 mg every 12 hours for 7-14 days or 1000 mg (two 500 mg extended release tablets) once daily for 7 days

H. parainfluenzae: 500 mg every 12 hours for 7 days or 1000 mg (two 500 mg extended release tablets) once daily for 7 days

Acute maxillary sinusitis: Oral: 500 mg every 12 hours **or** 1000 mg (two 500 mg extended release tablets) once daily for 14 days

Mycobacterial infection (prevention and treatment): Oral: 500 mg twice daily (use with other antimycobacterial drugs, eg, ethambutol or rifampin)

Peptic ulcer disease: Eradication of *Helicobacter pylori*: Dual or triple combination regimens with bismuth subsalicylate, amoxicillin, an H_2-receptor antagonist, or proton-pump inhibitor: 500 mg every 8-12 hours for 10-14 days

Pertussis (unlabeled use; CDC guidelines): Oral: 500 mg twice daily for 7 days

Pharyngitis, tonsillitis: Oral: 250 mg every 12 hours for 10 days

Pneumonia: Oral:

C. pneumoniae, *M. pneumoniae*, and *S. pneumoniae*: 250 mg every 12 hours for 7-14 days **or** 1000 mg (two 500 mg extended release tablets) once daily for 7 days

H. influenzae: 250 mg every 12 hours for 7 days **or** 1000 mg (two 500 mg extended release tablets) once daily for 7 days

H. parainfluenzae and *M. catarrhalis*: 1000 mg (two 500 mg extended release tablets) once daily for 7 days

Prophylaxis against infective endocarditis (unlabeled use): Oral: 500 mg 30-60 minutes prior to procedure. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Skin and skin structure infection, uncomplicated: Oral: 250 mg every 12 hours for 7-14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Community-acquired pneumonia, sinusitis, bronchitis, skin infections: Oral: 15 mg/kg/day divided every 12 hours for 10 days

Mycobacterial infection (prevention and treatment): Oral: 7.5 mg/kg (up to 500 mg) twice daily. **Note:** Safety of clarithromycin for MAC not studied in children <20 months.

Pertussis (unlabeled use; CDC guidelines): Oral:

Children 1-5 months: 15 mg/kg/day divided every 12 hours for 7 days

Children ≥6 months: 15 mg/kg/day divided every 12 hours for 7 days (maximum: 1 g/day)

Prophylaxis against infective endocarditis (unlabeled use): Oral: 15 mg/kg 30-60 minutes before procedure (maximum: 500 mg). **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: Half the normal dose or double the dosing interval.

In combination with ritonavir:

Cl_{cr} 30-60 mL/minute: Reduce dose by 50%.

Cl_{cr} <30 mL/minute: Reduce dose by 75%.

Dosing: Hepatic ImpairmentNo dosing adjustment is needed as long as renal function is normal.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralClarithromycin immediate release tablets and oral solution may be given with or without meals. Give every 12 hours rather than twice daily to avoid peak and trough variation.

Biaxin® XL: Should be given with food. Do not crush or chew extended release tablet.

Dietary ConsiderationsClarithromycin immediate release tablets and oral solution may be given with or without meals. May be taken with milk. Biaxin® XL should be taken with food.

StorageStore tablets and granules for oral suspension at controlled room temperature. Reconstituted oral suspension should not be refrigerated because it might gel. Microencapsulated particles of clarithromycin in suspension is stable for 14 days when stored at room temperature.

ContraindicationsHypersensitivity to clarithromycin, erythromycin, or any macrolide antibiotic; use with ergot derivatives, pimozide, cisapride

Allergy Considerations

- Macrolide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Macrolides have been associated with rare QT_c prolongation and ventricular arrhythmias, including torsade de pointes; use with caution in patients at risk of prolonged cardiac repolarization.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Coronary artery disease (CAD): Use with caution in patients with CAD; postmarketing safety trial suggests increased risk of cardiovascular mortality with short-term clarithromycin use (vs placebo) in patients with stable CAD. However, more smokers were randomized to the clarithromycin arm.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; exacerbation of symptoms and new onset of symptoms has occurred.

- Renal impairment: Dosage adjustment required with severe renal impairment; decreased dosage or prolonged dosing interval may be appropriate.

Concurrent drug therapy issues:

- Colchicine: Colchicine toxicity (including fatalities) has been reported with concomitant use. Use caution in the elderly and patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 months of age.

Dosage form specific issues:

- Extended release formulation: The extended release formulation consists of drug within a nondeformable matrix; following drug release/absorption, the matrix/shell is expelled in the stool. The use of nondeformable products in patients with known stricture/narrowing of the GI tract has been associated with symptoms of obstruction.

Geriatric ConsiderationsConsidered one of the drugs of choice in the outpatient treatment of community-acquired pneumonia in elderly. After doses of 500 mg every 12 hours for 5 days, 12 healthy elderly subjects had significantly increased C_{max} and C_{min}, elimination half-lives of clarithromycin and 14-OH clarithromycin compared to 12 healthy young subjects. These changes were attributed to a significant decrease in renal clearance; at a dose of 1000 mg twice daily, 100% of 13 elderly subjects experienced an adverse event compared to only 10% taking 500 mg twice daily.

Pregnancy Risk FactorC

Pregnancy ConsiderationsClarithromycin crosses the placenta. Although no teratogenic effects have been reported in humans, adverse fetal effects have been documented in animal studies; therefore, clarithromycin is classified as pregnancy category C. The manufacturer recommends that clarithromycin not be used in a pregnant woman unless there are no alternative therapies. No adequate and well-controlled studies have been completed in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if clarithromycin is excreted in human breast milk, but other macrolides are excreted in human milk and clarithromycin is known to be excreted into animal milk. The manufacturer recommends that caution be exercised when administering clarithromycin to breast-feeding women.

No data is available on infants exposed via human milk. Other macrolides are considered compatible with breast-feeding and clarithromycin is used therapeutically in infants. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Clarithromycin in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Headache (adults and children 2%)

Dermatologic: Rash (children 3%)

Gastrointestinal: Abnormal taste (adults 3% to 7%), diarrhea (adults 3% to 6%; children 6%), vomiting (children 6%), nausea (adults 3%), abdominal pain (adults 2%; children 3%), dyspepsia (adults 2%)

Hepatic: Prothrombin time increased (1%)

Renal: BUN increased (4%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): *Clostridium difficile* colitis, alkaline phosphatase increased, anaphylaxis, anorexia, anxiety, behavioral changes, bilirubin increased, confusion, disorientation, GGT increased, glossitis, hallucinations, hearing loss (reversible), hepatic dysfunction, hepatic failure, hepatitis, hypoglycemia, insomnia, interstitial nephritis, jaundice, leukopenia, manic behavior, neutropenia, oral moniliasis, pancreatitis, psychosis, QT prolongation, seizure, serum creatinine increased, Stevens-Johnson syndrome, stomatitis, thrombocytopenia, tinnitus, tongue discoloration, tooth discoloration (reversible), torsade de pointes, toxic epidermal necrolysis, transaminases increased, tremor, urticaria, ventricular tachycardia, ventricular arrhythmia, vertigo

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (strong)

Drug Interactions

Alfentanil: Macrolide Antibiotics may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Macrolide Antibiotics may decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Macrolide Antibiotics may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: Macrolide Antibiotics may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Macrolide Antibiotics may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Macrolide Antibiotics may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Macrolide Antibiotics may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Macrolide Antibiotics may decrease the metabolism of Cisapride. *Risk X: Avoid combination*

Clopidogrel: Macrolide Antibiotics may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Clozapine: Macrolide Antibiotics may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Colchicine: Macrolide Antibiotics may decrease the metabolism of Colchicine. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Macrolide Antibiotics may decrease the metabolism of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

CycloSPORINE: Macrolide Antibiotics may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Macrolide Antibiotics may enhance the QTc-prolonging effect of Disopyramide. Macrolide Antibiotics may decrease the metabolism of Disopyramide. *Risk X: Avoid combination*

Eletriptan: Macrolide Antibiotics may decrease the metabolism of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Macrolide Antibiotics may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Macrolide Antibiotics may enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Cabergoline. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Macrolide Antibiotics may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Macrolide Antibiotics may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Macrolide Antibiotics may decrease the metabolism of Pimozide. QTc prolongation is a risk. *Risk X: Avoid combination*

Protease Inhibitors: May diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Macrolide Antibiotics may decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Macrolide Antibiotics may increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: Macrolide Antibiotics may decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Rifapentine. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Selective Serotonin Reuptake Inhibitors: Macrolide Antibiotics may decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Fluvoxamine; PARoxetine. *Risk C: Monitor therapy*

Sirolimus: Macrolide Antibiotics may decrease the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tacrolimus: Macrolide Antibiotics may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: Macrolide Antibiotics may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Theophylline Derivatives: Macrolide Antibiotics may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Macrolide Antibiotics may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Zopiclone: Macrolide Antibiotics may increase the serum concentration of Zopiclone. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Immediate release: Food delays rate, but not extent of absorption; Extended release: Food increases clarithromycin AUC by ~30% relative to fasting conditions.

Herb/Nutraceutical: St John's wort may decrease clarithromycin levels.

Monitoring ParametersCBC with differential, BUN, creatinine; perform culture and sensitivity studies prior to initiating drug therapy

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to therapy. Use with caution in presence of severe renal impairment, myasthenia gravis, or coronary artery disease. Assess for potential adverse interactions or toxicity with any other prescription, OTC, or herbal products patient may be taking. Evaluate results of laboratory monitoring with long-term use. Assess therapeutic effectiveness (according to purpose for use) and adverse reactions. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, BUN, creatinine; perform culture and sensitivity studies prior to initiating drug therapy

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take exactly as prescribed and complete full course of therapy, even if feeling better. Tables and suspension may be taken with or without meals or milk. Extended release formulation (XL) should be taken with meals; do not break or chew extended release tablets. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluids. May cause nausea, heartburn, or abnormal taste (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or headaches or abdominal pain (consult prescriber for analgesic). Report rapid heartbeat or palpitations, persistent fever or chills, easy bruising or bleeding, joint pain, severe persistent diarrhea, skin rash, sores in mouth, foul-smelling urine, or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Granules for oral suspension: 125 mg/5 mL (50 mL, 100 mL); 250 mg/5 mL (50 mL, 100 mL)

Biaxin®: 125 mg/5 mL (50 mL, 100 mL); 250 mg/5 mL (50 mL, 100 mL) [fruit punch flavor]

Tablet: 250 mg, 500 mg

Biaxin®: 250 mg, 500 mg

Tablet, extended release: 500 mg

Biaxin® XL: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Suspension (reconstituted) (Clarithromycin)

125 mg/5 mL (50): $22.53

125 mg/5 mL (100): $41.91

250 mg/5 mL (50): $42.71

250 mg/5 mL (100): $76.72

Tablet, 24-hour (Biaxin XL)

500 mg (20): $115.38

Tablet, 24-hour (Biaxin XL Pac)

500 mg (14): $88.19

Tablets (Biaxin)

250 mg (60): $335.68

500 mg (20): $109.99

Tablets (Clarithromycin)

250 mg (30): $109.99

500 mg (30): $109.99

Mechanism of ActionExerts its antibacterial action by binding to 50S ribosomal subunit resulting in inhibition of protein synthesis. The 14-OH metabolite of clarithromycin is twice as active as the parent compound against certain organisms.

Pharmacodynamics/Kinetics

Absorption: Immediate release: Rapid; food delays rate, but not extent of absorption

Distribution: Widely into most body tissues except CNS

Protein binding: 42% to 50%

Metabolism: Partially hepatic via CYP3A4; converted to 14-OH clarithromycin (active metabolite)

Bioavailability: ~50%

Half-life elimination: Immediate release: Clarithromycin: 3-7 hours; 14-OH-clarithromycin: 5-9 hours

Time to peak: Immediate release: 2-3 hours

Excretion: Primarily urine (20% to 40% as unchanged drug; additional 10% to 15% as metabolite)

Clearance: Approximates normal GFR

Dental Health Professional ConsiderationsThe FDA issued a special alert in December 2005 stating that short-term therapy with clarithromycin in patients with stable coronary artery disease may cause significantly higher cardiovascular mortality. The use of 500 mg clarithromycin daily for 14 days in patients with the above condition resulted in significantly higher all-cause mortality compared to patients taking placebo. This information is provided to the dental practitioner on the possible association between short-term use of clarithromycin for infections and increases in mortality in patients with a history of stable coronary artery disease.

Clarithromycin is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Clarithromycin is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsClarithromycin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution. See Dental Comment.

Mental Health: Effects on Mental StatusMacrolides have been reported to cause nightmares, confusion, anxiety, and mood lability

Mental Health: Effects on Psychiatric TreatmentContraindicated with pimozide; increases carbamazepine and triazolam levels; monitor for signs of toxicity

Cardiovascular ConsiderationsBecause of potential drug interactions, serious arrhythmias may occur when clarithromycin and other macrolides are used in combination with cisapride. Clarithromycin may also increase theophylline, some HMG-CoA reductase inhibitors, digoxin, warfarin, and cyclosporine levels (among others). Clarithromycin may be used in penicillin-allergic patients for prevention of bacterial endocarditis.

The FDA issued an alert for clarithromycin (Biaxin®, Abbott Laboratories) on December 8, 2005. These actions were based upon results of a Danish trial (CLARICOR) that was recently published online in the British Medical Journal (Jesperson, 2005). This was a multicenter, double-blind, randomized, placebo-controlled trial evaluating the effects of clarithromycin (500 mg daily for 14 days) on mortality in patients with stable coronary artery disease. Over 13,000 patients having a discharge diagnosis (from 1993-99) of myocardial infarction or angina pectoris were recruited for the trial. The primary outcome was a composite of all cause mortality, MI, or unstable angina during the three-year follow up. The secondary outcome measure consisted of cardiovascular mortality, MI, or unstable angina. Two thousand one hundred and seventy two patients were randomized to clarithromycin and 2200 to placebo. The groups were well matched except there were more smokers in the clarithromycin group. Compliance was over 90% in both groups. There was no difference between the two groups with regard to the composite outcomes (primary or secondary). All cause mortality was significantly higher in the clarithromycin group (HR 1.27; CI 1.03-1.54; p = 0.03) as a result of a higher cardiovascular mortality (HR 1.45; CI 1.09-1.92; p = 0.01). When a multivariant analysis was done, all cause mortality was insignificantly increased (HR 1.21; CI 0.99-1.48; p = 0.07), but cardiovascular mortality continued to be significantly increased in the clarithromycin group (HR 1.38; CI 1.03-1.85; p = 0.03). One hundred and eighty four patients died in the clarithromycin group (89 from cardiovascular events) and 159 patients died in the placebo group (70 from cardiovascular events). The authors conclude that short-term clarithromycin therapy in patients with stable coronary artery disease may cause significantly higher cardiovascular mortality. This result came as a surprise to the authors who were not evaluating the safety of clarithromycin in patients with CAD. Further study is needed to evaluate the clinical validity of this unexpected finding.

Clemastine

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(KLEM as teen)

U.S. Brand NamesDayhist® Allergy [OTC]; Tavist® Allergy [OTC]

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsPerennial and seasonal allergic rhinitis and other allergic symptoms including urticaria

Dosing: Adults

Rhinitis or allergic symptoms (including urticaria): Oral:

1.34 mg clemastine fumarate (1 mg base) twice daily to 2.68 mg (2 mg base) 3 times/day; do not exceed 8.04 mg/day (6 mg base)

OTC labeling: 1.34 mg clemastine fumarate (1 mg base) twice daily; do not exceed 2 mg base/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Rhinitis or other allergic symptoms (including urticaria): Oral:

Infants and Children <6 years: 0.05 mg/kg/day as **clemastine base** or 0.335-0.67 mg/day clemastine fumarate (0.25-0.5 mg base/day) divided into 2 or 3 doses; maximum daily dosage: 1.34 mg (1 mg base)

Children 6-12 years: 0.67-1.34 mg clemastine fumarate (0.5-1 mg base) twice daily; do not exceed 4.02 mg/day (3 mg/day base)

Children ≥12 years: Refer to adult dosing.

ContraindicationsHypersensitivity to clemastine or any component of the formulation; narrow-angle glaucoma

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with a history of asthma.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Increased intraocular pressure: Use with caution in patients with increased intraocular pressure.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Pregnancy Risk FactorB

LactationEnters breast milk/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, hypotension, tachycardia

Central nervous system: Dyscoordination, sedation, somnolence slight to moderate, sleepiness, confusion, restlessness, nervousness, insomnia, irritability, fatigue, headache, dizziness increased

Dermatologic: Rash, photosensitivity

Gastrointestinal: Diarrhea, nausea, xerostomia, epigastric distress, vomiting, constipation

Genitourinary: Urinary frequency, difficult urination, urinary retention

Hematologic: Hemolytic anemia, thrombocytopenia, agranulocytosis

Ocular: Blurred vision

Otic: Tinnitus

Respiratory: Thickening of bronchial secretions

Miscellaneous: Anaphylaxis

Metabolism/Transport Effects**Inhibits** CYP2D6 (weak), 3A4 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Monitoring ParametersLook for a reduction of rhinitis, urticaria, eczema, pruritus, or other allergic symptoms
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup, as fumarate: 0.67 mg/5 mL (120 mL, 480 mL) [prescription formulation; 0.5 mg base/5 mL]

Tablet, as fumarate: 1.34 mg [1 mg base; OTC], 2.68 mg [2 mg base; prescription formulation]

Dayhist® Allergy, Tavist® Allergy: 1.34 mg [1 mg base]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Syrup (Clemastine Fumarate)

0.67 mg/5 mL (120): $18.98

Tablets (Clemastine Fumarate)

1.34 mg (100): $25.99

2.68 mg (30): $17.99

Tablets (Tavist-1)

1.34 mg (32): $14.99

Mechanism of ActionCompetes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract
Pharmacodynamics/Kinetics

Onset of action: Peak effect: Therapeutic: 5-7 hours

Duration: 8-16 hours

Absorption: Almost complete

Metabolism: Hepatic

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness is common; may cause nervousness; rare reports of depression
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may result in additive sedation
Index TermsClemastine Fumarate

Clevidipine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Clevidipine may be confused with cladribine, clofarabine, clomiPRAMINE

Cleviprex™ may be confused with Claravis™

Pronunciation(klev ID i peen)

U.S. Brand NamesCleviprex™

Pharmacologic CategoryCalcium Channel Blocker

Use: Labeled IndicationsManagement of hypertension when oral treatment is not feasible or not desirable

Dosing: Adults Management of hypertension: I.V.: Initial: 1-2 mg/hour

Titration: Initial: dose may be doubled at 90-second intervals toward blood pressure goal. As blood pressure approaches goal, dose may be increased by less than double every 5-10 minutes. **Note:** For every 1-2 mg/hour increase in dose, an approximate reduction of 2-4 mm Hg in systolic blood pressure may occur.

Usual maintenance: 4-6 mg/hour; maximum: 21 mg/hour (1000 mL within a 24-hour period). There is limited short-term experience with doses up to 32 mg/hour. Data is limited beyond 72 hours.

Dosing: ElderlyRefer to adult dosing. Initiate at the low end of the dosage range. Specific guidelines for adjustment of clevidipine are not available, but careful monitoring is warranted.

Dosing: Renal ImpairmentNo adjustment required with initial infusion rate.

Dosing: Hepatic ImpairmentNo adjustment required with initial infusion rate.

Administration: I.V.I.V.: Maintain aseptic technique. Do not use if contamination is suspected. Do not dilute. Invert vial gently several times to ensure uniformity of emulsion prior to administration. Administer as a slow continuous infusion via central or peripheral line, using infusion device allowing for calibrated infusion rates. Use within 4 hours of puncturing vial; discard any tubing and unused portion, including that currently being infused.

Administration: I.V. DetailpH: 6.0-8.0

Dietary ConsiderationsClevidipine is formulated in an oil-in-water emulsion containing 200 mg/mL of lipid (2 kcal/mL). If on parenteral nutrition, may need to adjust the amount of lipid infused. Emulsion contains soybean oil, egg yolk phospholipids, and glycerin.

StorageStore in refrigerator at 2°C to 8°C (36°F to 46°F). Unopened vials are stable for 2 months at room temperature. Vials are stable for 4 hours once opened. Protect from light during storage. Do not freeze.

CompatibilityDo not mix with or administer in same line with other medications.

Y-site administration: Compatible I.V. solutions: D_5LR, D_5NS, D_5W, LR, NS, 10% amino acids, SWFI

ContraindicationsHypersensitivity to clevidipine or any component of the formulation (soybeans, soy products, eggs, egg products); impaired lipid metabolism (hyperlipidemia with or without acute pancreatitis, lipoid nephrosis); severe aortic stenosis

Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Dosage reductions may be necessary.
- Rebound hypertension: May occur with prolonged use in patients not transitioned to other antihypertensive therapy; monitor these patients carefully for at least 8 hours after discontinuation of infusion.
- Reflex tachycardia: May occur with use and may result in angina or myocardial infarction in patients with obstructive coronary disease; dosage reductions may be necessary. Treatment of clevidipine-induced tachycardia with beta-blockers is **not** recommended.

Disease-related concerns:

- Heart failure (HF): Use with caution in patients with HF. Dihydropyridine calcium channel blockers may cause negative inotropic effects and exacerbate heart failure. Monitor carefully.
- Disorders of lipid metabolism: Use with caution in patients with disorders of lipid metabolism. Clevidipine is formulated within a 20% fat emulsion (0.2 g/mL). A reduction in the quantity of concurrently administered lipids may be necessary. Use is contraindicated in patients with impaired lipid metabolism (hyperlipidemia with or without acute pancreatitis, lipoid nephrosis).
- Pheochromocytoma: Use in hypertension associated with pheochromocytoma has not been studied.

Concurrent drug therapy issues:

- Beta-blockers: Avoid abrupt withdrawal of concomitant beta-blocker therapy. Gradually reduce dose of beta-blocker therapy when initiating clevidipine.

Special populations:

- Elderly: Initiate therapy at the low end of the dosage range in the elderly. If clinically indicated, titrate dose upward cautiously.

- Pediatrics: Safety and efficacy have not been established in children less than 18 years of age.

Other warnings/precautions:

- Infection risk: Vials have the potential to support microbial growth. To limit the potential for contamination, maintain aseptic technique while handling.

Geriatric ConsiderationsNo overall differences in safety or efficacy noted in the initial studies in elderly. Doses should be started at low end of dosage range and titrated slowly since elderly may experience a greater hypotensive response, reflecting their greater frequency of renal and cardiac disease with decreased function and concomitant drug therapy.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in animal reproduction studies. There are no adequate and well-controlled studies in pregnant women. Use only if potential benefit justifies potential risks.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Atrial fibrillation (13% to 21%)

Central nervous system: Fever (19%), insomnia (12%)

Gastrointestinal: Nausea (5% to 21%)

1% to 10%:

Central nervous system: Headache (6%)

Gastrointestinal: Vomiting (3%)

Hematologic: Postprocedural hemorrhage (3%)

Renal: Acute renal failure (9%)

Respiratory: Pneumonia (3%), respiratory failure (3%)

<1% (Limited to important or life-threatening): Cardiac arrest, dyspnea, MI, syncope, thrombophlebitis

Drug Interactions

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, heart rate; patients who receive prolonged infusions of clevidipine and are not transitioned to other antihypertensive therapy should be monitored for at least 8 hours after discontinuation

Nursing: Physical Assessment/MonitoringAssess allergy history prior to treatment (soybeans or soy products, eggs or egg products). Use caution in presence of impaired lipid metabolism or heart failure. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (eg, beta-blockers or agents that may impact blood pressure control). See Administration for I.V. specifics. Assess therapeutic effectiveness (cardiac status and blood pressure) closely and titrate upward carefully, if needed. Patient should be monitored for a minimum of 8 hours after discontinuation (rebound hypertension may occur). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationThis medication can only be administered by infusion. Report immediately any pain, burning, or swelling at infusion site or any signs of allergic reaction (eg, respiratory difficulty or swallowing, back pain, chest tightness, rash, hives, swelling of lips or mouth). Ask for assistance when rising or changing position until response to drug is known. Report chest pain or palpitations; headache or dizziness; nausea or vomiting; difficulty breathing; or any other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, emulsion:

Cleviprex™: 0.5 mg/mL (50 mL, 100 mL) [contains eggs, soy products]

Generic AvailableNo

Mechanism of ActionDihydropyridine calcium channel blocker with potent arterial vasodilating activity. Inhibits calcium ion influx through the L-type calcium channels during depolarization in arterial smooth muscle, producing a decrease in mean arterial pressure (MAP) by reducing systemic vascular resistance.

Pharmacodynamics/Kinetics

Onset of action: 2-4 minutes after start of infusion

Duration: I.V.: 5-15 minutes

Distribution: V_{dss}: 0.17 L/kg

Protein binding: >99.5%

Metabolism: Rapid hydrolysis primarily by esterases in blood and extravascular tissues to an inactive carboxylic acid metabolite and formaldehyde

Half-life elimination: Biphasic: Initial: 1 minute (predominant); Terminal: 15 minutes

Excretion: Urine (63% to 74% as metabolites); feces (7% to 22% as metabolites)

Related Information

Clidinium and Chlordiazepoxide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Librax® may be confused with Librium®

Librax® formulation may be cause for confusion:

In November 2004, Valeant Pharmaceuticals licensed the Librax® trademark to Victory Pharmaceuticals. Subsequently, the product was reformulated to contain chlordiazepoxide and methscopolamine. In January 2006, Valeant Pharmaceuticals began redistributing the original formulation of Librax®, containing clidinium and chlordiazepoxide. Victory Pharmaceuticals has discontinued their product. **Note:** The formulation of Librax® distributed in Canada (Valeant Canada Ltd) always contained clidinium and chlordiazepoxide.

Pronunciation(kli DI nee um & klor dye az e POKS ide)

U.S. Brand NamesLibrax® *[original formulation]*

Canadian Brand NamesApo-Chlorax®; Librax®

Pharmacologic CategoryAntispasmodic Agent, Gastrointestinal; Benzodiazepine

Use: Labeled IndicationsAdjunct treatment of peptic ulcer; treatment of irritable bowel syndrome

Dosing: AdultsAdjunct treatment of peptic ulcer; treatment of IBS: Oral: 1-2 capsules 3-4 times/day, before meals or food and at bedtime. **Caution:** Do not abruptly discontinue after prolonged use; taper dose gradually.

Dosing: ElderlyRefer to adult dosing.

Administration: Oral**Caution:** Do not abruptly discontinue after prolonged use; taper dose gradually.

Dietary ConsiderationsShould be taken before meals.

ContraindicationsHypersensitivity to clidinium, chlordiazepoxide, or any component of the formulation; glaucoma; prostatic hyperplasia; benign bladder neck obstruction; pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsThe use of anticholinergic agents may cause problems with bladder emptying, constipation or cause confusion. The addition of chlordiazepoxide may enhance confusion potential. Monitor closely initially.
Pregnancy Risk FactorD
Pregnancy ConsiderationsAn increased risk of congenital malformations has been associated with the use of minor tranquilizers during the 1st trimester. Because use of these drugs is rarely a matter of urgency, their use should be avoided during this period.
LactationEnters breast milk/contraindicated
Adverse Reactions

1% to 10%:

Central nervous system: Drowsiness, ataxia, confusion, anticholinergic side effects

Gastrointestinal: Dry mouth, constipation, nausea

<1% (Limited to important or life-threatening): Agranulocytosis, blood dyscrasias, extrapyramidal symptoms, hepatic dysfunction, jaundice, syncope

Metabolism/Transport EffectsChlordiazepoxide: **Substrate** of CYP3A4 (major)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor for CNS depression. Assess knowledge/teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, liver function

Patient EducationTake as directed before meals; do not increase dose and do not discontinue this medication without consulting prescriber first. Avoid alcohol and other CNS depressant medications (antihistamines, sleeping aids, antidepressants) unless approved by prescriber. Void before taking medication. This drug may impair mental alertness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report excessive and persistent anticholinergic effects (blurred vision, headache, flushing, tachycardia, nervousness, constipation, dizziness, insomnia, mental confusion or excitement, dry mouth, altered taste perception, dysphagia, palpitations, bradycardia, urinary hesitancy or retention, impotence, decreased sweating), or change in color of urine or stools. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause confusion

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may result in additive sedation

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Index TermsChlordiazepoxide and Clidinium

Jump To Field (Select Field Name)

Pronunciation(klin da MYE sin & BEN zoe il peer OKS ide)
U.S. Brand NamesBenzaClin®; Duac® CS; Duac® [DSC]
Canadian Brand NamesBenzaClin®
Pharmacologic CategoryAcne Products; Topical Skin Product; Topical Skin Product, Acne
Use: Labeled IndicationsTopical treatment of acne vulgaris
Dosing: AdultsApply to affected areas after skin has been cleansed and dried:

Acne:*BenzaClin®:* Topical: Apply twice daily (morning and evening)

Inflammatory acne:*Duac® CS:* Topical: Apply once daily in the evening

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥12 years: Refer to adult dosing.
Administration: TopicalSkin should be clean and dry before applying. For external use only; avoid applying to inside nose, mouth, eyes, and mucous membranes.
Storage

BenzaClin®: Store at room temperature of 25°C (77°F). Do not freeze.

Duac® CS: Prior to dispensing, store in refrigerator, between 2°C to 8°C (36°F to 46°F). Once dispensed, may be stored by patient at room temperature of up to 25°C (77°F) if used within 60 days. Do not freeze.

ReconstitutionBenzaClin®: Reconstitute clindamycin with purified water; shake well. Add solution to benzoyl peroxide gel and stir until homogenous in appearance. Discard unused portion after 3 months.
ContraindicationsHypersensitivity to benzoyl peroxide, clindamycin, lincomycin, or any component of the formulation; history of regional enteritis, ulcerative colitis, pseudomembranous colitis or antibiotic-associated colitis
Allergy Considerations

- Lincosamide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bleaching effects: May bleach hair or colored fabric.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Concurrent drug therapy issues:

- Erythromycin: Concomitant use with erythromycin-containing products is not recommended.
- Topical acne products: Use concomitant topical acne therapy with caution; cumulative irritancy may occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with mucous membranes and eyes.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted; use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsClindamycin is excreted in breast milk following oral and parenteral administration; the extent of excretion, if any, following topical use, in this combination is not known.
Adverse Reactions

>10%: Dermatologic: Erythema (1% to 26%), peeling (2% to 17%), dry skin (1% to 15%)

1% to 10%: Dermatologic: Pruritus (2%), sunburn (1%), burning (<1% to 5%)

Postmarketing and/or case reports: Allergic reactions, anaphylaxis, colitis, diarrhea, pseudomembranous colitis

Drug Interactions

Erythromycin: Lincosamide Antibiotics may diminish the therapeutic effect of Erythromycin. *Risk X: Avoid combination*

Kaolin: May decrease the absorption of Lincosamide Antibiotics. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Lincosamide Antibiotics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Patient EducationReport persistent diarrhea.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Gel, topical:

BenzaClin®: Clindamycin phosphate 1% and benzoyl peroxide 5% (25 g, 50 g)

Duac®: Clindamycin phosphate 1% and benzoyl peroxide 5% (45 g) [DSC]

Duac® CS: Clindamycin phosphate 1% and benzoyl peroxide 5% (45 g) [packaged with SFC™ lotion 107 mL]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Gel (Benzaclin)

1-5% (25): $89.99

1-5% (50): $145.99

Gel (Benzaclin with Pump)

1-5% (50): $152.15

Kit (Duac CS)

1-5% (1): $153.29

Mechanism of ActionClindamycin and benzoyl peroxide have activity against *Propionibacterium acnesin vitro*. This organism has been associated with acne vulgaris. Benzoyl peroxide releases free-radical oxygen which oxidizes bacterial proteins in the sebaceous follicles decreasing the number of anaerobic bacteria and decreasing irritating-type free fatty acids. Clindamycin reversibly binds to 50S ribosomal subunits preventing peptide bond formation thus inhibiting bacterial protein synthesis; bacteriostatic or bactericidal depending on drug concentration, infection site, and organism.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Benzoyl Peroxide
- Clindamycin

Pharmacologic CategoryAcne Products; Retinoic Acid Derivative; Topical Skin Product; Topical Skin Product, Acne

Use: Labeled IndicationsTreatment of acne vulgaris

Dosing: AdultsAcne: Topical: Apply pea-size amount to entire face once daily at bedtime

Dosing: PediatricAcne: Topical: Children ≥12 years: Refer to adult dosing.

Administration: TopicalAt bedtime, clean face with a mild soap and pat dry before applying medication. A pea-size amount should be applied to one fingertip and then dotted on chin, cheeks, nose, and forehead. Gently rub over entire face avoiding eyes, mouth, angles of nose, and mucous membranes.

StorageStore at 15°C to 30°C (68°F to 77°F); do not freeze. Protect from light.

Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: Tretinoin use is associated with increased susceptibility/sensitivity to UV light; avoid sunlamps or excessive sunlight exposure. Daily sunscreen use and other protective measures recommended.
- Skin irritation: Treatment can increase skin sensitivity to weather extremes of wind or cold. Also, concomitant topical medications (eg, medicated or abrasive soaps, cleansers, or cosmetics with a strong drying effect) should be used with caution due to increased skin irritation.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: For external use only; avoid mucous membranes, eyes, mouth, and angles of nose.

Geriatric ConsiderationsHas not been studied in elderly patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in topical animal studies. Refer to individual monographs.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Dermatologic: Erythema (26% to 35%), scaling (13% to 17%)

1% to 10%:

Dermatologic: Itching (4% to 10%), burning (2% to 4%), stinging (2%), dry skin (1%)

Gastrointestinal: GI symptoms, unspecified (4%)

Respiratory: Nasopharyngitis (4%)

Drug Interactions

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, topical:

Ziana™: Clindamycin phosphate 1.2% and tretinoin 0.025% (30 g, 60 g)

Generic AvailableNo
ManufacturerMedicis
Pricing: U.S. (www.drugstore.com)

Gel (Ziana)

1.2-0.025% (30): $155.90

1.2-0.025% (60): $309.52

Mechanism of ActionClindamycin reversibly binds to 50S ribosomal subunits preventing peptide chain elongation thus inhibiting bacterial protein synthesis. Clindamycin exhibits *in vitro* activity against *Propionibacterium acnes*, an organism associated with acne vulgaris. Topical tretinoin is believed to decrease follicular epithelial cells cohesiveness and increase follicular epithelial cell turnover resulting in decreased microcomedo formation and increased expulsion of comedones.
Pharmacodynamics/KineticsAbsorption: Topical: Tretinoin: Minimal systemic absorption; Clindamycin: Low, but variable systemic absorption
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentDiarrhea may occur with topical clindamycin. Concomitant use with SSRI, lithium, carbamazepine, or valproic acid and derivatives may produce additive effects. Tretinoin and psychotropics are associated with photosensitivity; monitor.
Index TermsClindamycin Phosphate and Tretinoin; Tretinoin and Clindamycin

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cleocin® may be confused with bleomycin, Clinoril®, Cubicin®, Lincocin®

Clindamycin may be confused with clarithromycin, Claritin®, vancomycin

Pronunciation(klin da MYE sin)

U.S. Brand NamesCleocin HCl®; Cleocin Pediatric®; Cleocin Phosphate®; Cleocin T®; Cleocin®; Cleocin® Vaginal Ovule; Clindagel®; ClindaMax®; ClindaReach™; Clindesse™; Evoclin®

Canadian Brand NamesAlti-Clindamycin; Apo-Clindamycin®; Clindamycin Injection, USP; Clindoxyl®; Dalacin® C; Dalacin® T; Dalacin® Vaginal; Gen-Clindamycin; Novo-Clindamycin; PMS-Clindamycin; ratio-Clindamycin; Riva-Clindamycin; Taro-Clindamycin

Pharmacologic CategoryAntibiotic, Lincosamide; Topical Skin Product, Acne

Use: Labeled IndicationsTreatment of susceptible bacterial infections, mainly those caused by anaerobes, streptococci, pneumococci, and staphylococci; bacterial vaginosis (vaginal cream, vaginal suppository); pelvic inflammatory disease (I.V.); topically in treatment of severe acne; vaginally for *Gardnerella vaginalis*

Use: Unlabeled/InvestigationalMay be useful in PCP; alternate treatment for toxoplasmosis

Use: DentalAlternate oral antibiotic for prevention of infective endocarditis in individuals allergic to penicillins or ampicillin, when amoxicillin cannot be used; alternate I.M. or I.V. antibiotic for prevention of infective endocarditis in patients allergic to penicillins or ampicillin and unable to take oral medication; alternate oral antibiotic for prophylaxis for dental patients with total joint replacement who are allergic to penicillin; alternate I.V. antibiotic for prophylaxis for dental patients with total joint replacement who are allergic to penicillin and unable to take oral medications; alternate antibiotic in the treatment of common orofacial infections caused by aerobic gram-positive cocci and susceptible anaerobes; treatment of periodontal disease

Dosing: Adults

Usual dose:

Oral: 150-450 mg/dose every 6-8 hours; maximum dose: 1.8 g/day

I.M., I.V.: 1.2-2.7 g/day in 2-4 divided doses; maximum dose: 4.8 g/day

Acne: *Topical:*

Gel, pledget, lotion, solution: Apply a thin film twice daily

Foam (Evoclin®): Apply once daily

Amnionitis:*I.V.:* 450-900 mg every 8 hours

Anthrax:*I.V.:* 900 mg every 8 hours with ciprofloxacin or doxycycline

Babesiosis (unlabeled use):

Oral: 600 mg 3 times/day for 7 days with quinine

I.V.: 1.2 g twice daily for 7 days with quinine

Bacterial vaginosis:*Intravaginal:*

Suppositories: Insert one ovule (100 mg clindamycin) daily into vagina at bedtime for 3 days

Cream:

Cleocin®: One full applicator inserted intravaginally once daily before bedtime for 3 or 7 consecutive days in nonpregnant patients or for 7 consecutive days in pregnant patients

Clindesse™: One full applicator inserted intravaginally as a single dose at anytime during the day in nonpregnant patients

Bite wounds (canine):*Oral:* 300 mg 4 times/day with a fluoroquinolone

Gangrenous pyomyositis:*I.V.:* 900 mg every 8 hours with penicillin G

Group B streptococcus (neonatal prophylaxis):*I.V.:* 900 mg every 8 hours until delivery

Orofacial/parapharyngeal space infections:

Oral: 150-450 mg every 6 hours for at least 7 days; maximum dose: 1.8 g/day

I.V.: 600-900 mg every 8 hours

Pelvic inflammatory disease: *I.V.:* 900 mg every 8 hours with gentamicin 2 mg/kg, then 1.5 mg/kg every 8 hours; continue after discharge with doxycycline 100 mg twice daily to complete 14 days of total therapy

Pneumonia due to*Pneumocystis jiroveci*(unlabeled use): I.V.: 600 mg every 8 hours with primaquineor pentamidine for 21 days

Prophylaxis against infective endocarditis (unlabeled use):

Oral: 600 mg 1 hour before procedure with no follow-up dose needed

I.M., I.V.: 600 mg within 30 minutes before procedure. Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications.

Note: American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Toxic shock syndrome:*I.V.:* 900 mg every 8 hours with penicillin G or ceftriaxone

Toxoplasmosis (unlabeled use):*Oral, I.V.:* 600 mg every 6 hours with pyrimethamine and folinic acid

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Usual dose:

Oral: Infants and Children: 8-20 mg/kg/day as hydrochloride; 8-25 mg/kg/day as palmitate in 3-4 divided doses; minimum dose of palmitate: 37.5 mg 3 times/day

I.M., I.V.:

<1 month: 15-20 mg/kg/day in 3-4 divided doses

>1 month: 20-40 mg/kg/day in 3-4 divided doses

Anthrax:*I.V.:* 7.5 mg/kg every 6 hours

Prophylaxis against infective endocarditis (unlabeled use):

Oral: 20 mg/kg 1 hour before procedure with no follow-up dose needed

I.M., I.V.: 20 mg/kg within 30 minutes before procedure. Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications.

Note: American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Orofacial infections:

Oral: 10-20 mg/kg in 3-4 equally divided doses

I.V.: 15-25 mg/kg in 3-4 equally divided doses

Acne: *Topical:* Children ≥12 years: Refer to adult dosing.

Babesiosis (unlabeled use): *Oral:* 20-40 mg/kg divided every 8 hours for 7 days plus quinine

Dosing: Renal ImpairmentNo adjustment required.
Dosing: Hepatic ImpairmentSystemic use: Adjustment is recommended in patients with severe hepatic disease.
Administration: I.M.Deep I.M. sites, rotate sites. Do not exceed 600 mg in a single injection.
Administration: I.V.**Never administer as bolus**; administer by I.V. intermittent infusion over at least 10-60 minutes, at a rate **not** to exceed 30 mg/minute (do not exceed 1200 mg/hour). Final concentration for administration should not exceed 18 mg/mL.
Administration: I.V. DetailpH: 6.0-6.3 (usual); 5.5-7.0 (range)
Administration: OralAdminister oral dosage form with a full glass of water to minimize esophageal ulceration. Give around-the-clock to promote less variation in peak and trough serum levels.
Administration: TopicalFoam: Dispense directly into cap or onto a cool surface. Do not dispense directly into hands.
Administration: Other

Intravaginal:

Cream: Insertion should be as far as possible into the vagina without causing discomfort.

Ovule: The foil should be removed; if the applicator is used for insertion, it should be washed for additional use.

Dietary ConsiderationsMay be taken with food.

Storage

Capsule: Store at room temperature of 20°C to 25°C (68°F to 77°F).

Cream: Store at room temperature.

Foam: Store at room temperature of 20°C to 25°C (68°F to 77°F). Avoid fire, flame, or smoking during or following application.

Gel: Store at room temperature.

Clindagel®: Do not store in direct sunlight.

I.V.: Infusion solution in NS or D_5W solution is stable for 16 days at room temperature, 32 days refrigerated, or 8 weeks frozen. Prior to use, store vials and premixed bags at controlled room temperature 20°C to 25°C (68°F to 77°F). After initial use, discard any unused portion of vial after 24 hours.

Lotion: Store at room temperature of 20°C to 25°C (68°F to 77°F).

Oral solution: Do not refrigerate reconstituted oral solution (it will thicken). Following reconstitution, oral solution is stable for 2 weeks at room temperature of 20°C to 25°C (68°F to 77°F).

Ovule: Store at room temperature of 15°C to 30°C (68°F to 77°F).

Pledget: Store at room temperature.

Topical solution: Store at room temperature of 20°C to 25°C (68°F to 77°F).

CompatibilityStable in D_5R, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, amifostine, amiodarone, amphotericin B cholesteryl sulfate complex, amsacrine, anakinra, aztreonam, bivalirudin, cefpirome sulfate, cisatracurium, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, fenoldopam, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, hydromorphone, labetalol, levofloxacin, linezolid, magnesium sulfate, melphalan, meperidine, midazolam, milrinone, morphine, multivitamins, nicardipine, ondansetron, pemetrexed, perphenazine, piperacillin/tazobactam, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine, vitamin B complex with C, zidovudine. **Incompatible:** Allopurinol, azithromycin, doxapram, filgrastim, fluconazole, idarubicin. **Variable (consult detailed reference):** Drotrecogin alfa.

Compatibility in syringe: Compatible: Amikacin, aztreonam, caffeine citrate, dimenhydrinate, gentamicin, heparin. **Incompatible:** Pantoprazole, tobramycin.

Compatibility when admixed: Compatible: Amikacin, ampicillin, aztreonam, cefamandole, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, cimetidine, fluconazole, gentamicin, heparin, hydrocortisone sodium succinate, kanamycin, methylprednisolone sodium succinate, metoclopramide, metronidazole, metronidazole with sodium bicarbonate, ofloxacin, penicillin G, piperacillin, potassium chloride, sodium bicarbonate, tobramycin, verapamil, vitamin B complex with C. **Incompatible:** Aminophylline, ampicillin, barbiturates, calcium gluconate, ceftriaxone, ciprofloxacin, gentamicin with cefazolin, magnesium sulfate, phenytoin. **Variable (consult detailed reference):** Ranitidine.

ContraindicationsHypersensitivity to clindamycin, lincomycin, or any component of the formulation

Topical and vaginal products: Additional contraindications: Previous pseudomembranous colitis, regional enteritis, ulcerative colitis

Allergy Considerations

- Lincosamide Allergy

Warnings/Precautions

Boxed warnings:

- Colitis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Colitis: **[U.S. Boxed Warning]: Can cause severe and possibly fatal colitis.** Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment. Use with caution in patients with a history of gastrointestinal disease. Discontinue drug if significant diarrhea, abdominal cramps, or passage of blood and mucus occurs.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; monitor hepatic enzymes periodically as dosage adjustments may be necessary in patients with severe impairment.

Special populations:

- Atopic patients: Use with caution in atopic patients.

Dosage form specific issues:

- Benzyl alcohol: Some products may contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

- Tartrazine: Some products may contain tartrazine, which may cause allergic reactions in certain individuals.

- Vaginal products: May weaken condoms, or contraceptive diaphragms; barrier contraceptives are not recommended concurrently or for 3-5 days (depending on the product) following treatment.

Geriatric ConsiderationsClindamycin has not been studied in the elderly; however, since it is eliminated principally by nonrenal mechanisms, major alteration in its pharmacokinetics are not expected. Elderly patients are often at a higher risk for developing serious colitis and require close monitoring.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsClindamycin is excreted into breast milk. Due to the potential for adverse reactions to neonate, the manufacturer recommends discontinuing the drug taking into account the importance to the mother.

Adverse Reactions

Systemic: Frequency not defined:

Cardiovascular: Cardiac arrest (rare; I.V. administration), hypotension (rare; I.V. administration)

Dermatologic: Erythema multiforme (rare), exfoliative dermatitis (rare), pruritus, rash, Stevens-Johnson syndrome (rare), urticaria

Gastrointestinal: Abdominal pain, diarrhea, esophagitis, nausea, pseudomembranous colitis, vomiting

Genitourinary: Vaginitis

Hematologic: Agranulocytosis, eosinophilia (transient), neutropenia (transient), thrombocytopenia

Hepatic: Jaundice, liver function test abnormal

Local: Induration/pain/sterile abscess (I.M.), thrombophlebitis (I.V.)

Neuromuscular & skeletal: Polyarthritis (rare)

Renal: Renal dysfunction (rare)

Miscellaneous: Anaphylactoid reactions (rare)

Topical:

>10%: Dermatologic: Dryness, burning, itching, scaliness, erythema, or peeling of skin (lotion, solution); oiliness (gel, lotion)

<1% (Limited to important or life-threatening): Pseudomembranous colitis, nausea, vomiting, diarrhea (severe), abdominal pain, folliculitis, hypersensitivity reactions

Vaginal:

>10%: Genitourinary: Vaginal candidiasis (≤13%), vulvovaginal pruritus (from *Candida albicans*)

1% to 10%:

Dermatologic: Pruritus (≤1%)

Genitourinary: Vulvovaginal disorder (3% to 7%), vulvovaginitis (4% to 6%), vaginal pain (≤2%), trichomonal vaginitis (1%)

Miscellaneous: Fungal infection (1% to 2%)

<1% (Limited to important or life-threatening): Abdominal cramps, allergic reaction, atrophic vaginitis, bacterial infection, diarrhea, dizziness, dysuria, endometriosis, epistaxis, erythema, fever, hypersensitivity, hyperthyroidism, local edema, menstrual disorder, metrorrhagia, nausea, pain, pruritus, pyelonephritis, rash, urinary tract infection, urticaria, vaginal burning, vertigo, vomiting

Drug Interactions

Erythromycin: Lincosamide Antibiotics may diminish the therapeutic effect of Erythromycin. *Risk X: Avoid combination*

Kaolin: May decrease the absorption of Lincosamide Antibiotics. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Lincosamide Antibiotics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Peak concentrations may be delayed with food.

Herb/Nutraceutical: St John's wort may decrease clindamycin levels.

Monitoring ParametersObserve for changes in bowel frequency. Monitor for colitis and resolution of symptoms. During prolonged therapy monitor CBC, liver and renal function tests periodically.

Nursing: Physical Assessment/MonitoringAssess previous allergy history prior to beginning therapy. **I.V.:** Cardiac status and blood pressure should be monitored and patient kept recumbent after infusion until blood pressure is stabilized. Assess results of laboratory tests and patient response according to dose, route of administration, and purpose of therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, severe diarrhea, opportunistic infection).

Monitoring: Lab TestsCBC, liver and renal function periodically with prolonged therapy

Patient Education

I.M., I.V.: Report any burning, pain, swelling, or redness at infusion or injection site.

Oral: Take each dose with a full glass of water. Complete full prescription, even if feeling better. You may experience nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report dizziness; persistent GI effects (pain, diarrhea, vomiting); skin redness, rash, or burning; fever; chills; unusual bruising or bleeding; signs of infection; excessive fatigue; yellowing of eyes or skin; change in color of urine or blackened stool; swelling, warmth, or pain in extremities; difficult respirations; bloody or fatty stool (do not take antidiarrheal without consulting prescriber); or lack of improvement or worsening of condition.

Topical, foam: Wash hands thoroughly or wear gloves. Do not dispense directly onto hands or face (foam will begin to melt on contact with warm skin). Dispense an amount the will cover the affected area directly into the cap or onto a cool surface. If can seems warm or foam seems runny, run can under cold water. Pick up small amounts of foam with fingertips and gently massage into affected areas until foam disappears. Wash hands thoroughly. Wait 30 minutes before shaving or applying make-up.

Topical gel, lotion, or solution: Wash hands thoroughly before applying or wear gloves. Apply thin film of gel, lotion, or solution to affected area. May apply porous dressing. Wash hands thoroughly. Wait 30 minutes before shaving or applying make-up. Report persistent burning, swelling, itching, excessive dryness, or worsening of condition.

Vaginal: Wash hands before using. At bedtime: If using applicator, gently insert full applicator into vagina and expel cream. Wash applicator with soap and water following use. If using suppository, insert high into vagina. Remain lying down for 30 minutes following administration. Avoid intercourse during therapy. Report adverse reactions (dizziness, nausea, vomiting, stomach cramps, or headache) or lack of improvement or worsening of condition.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength is expressed as base

Capsule, as hydrochloride: 75 mg, 150 mg, 300 mg

Cleocin HCl®: 75 mg [contains tartrazine], 150 mg [contains tartrazine], 300 mg

Cream, vaginal, as phosphate:

Cleocin®: 2% (40 g) [contains benzyl alcohol and mineral oil; packaged with 7 disposable applicators]

ClindaMax®: 2% (40 g) [contains benzyl alcohol and mineral oil; packaged with 7 disposable applicators]

Clindesse™: 2% (5 g) [contains mineral oil; prefilled single disposable applicator]

Foam, topical, as phosphate:

Evoclin®: 1% (50 g, 100 g) [contains ethanol 58%]

Gel, topical, as phosphate: 1% (30 g, 60 g)

Cleocin T®: 1% (30 g, 60 g)

Clindagel®: 1% (40 mL, 75 mL)

ClindaMax®: 1% (30 g, 60 g)

Granules for oral solution, as palmitate:

Cleocin Pediatric®: 75 mg/5 mL (100 mL) [cherry flavor]

Infusion, as phosphate [premixed in D_5W]:

Cleocin Phosphate®: 300 mg (50 mL); 600 mg (50 mL); 900 mg (50 mL) [contains benzyl alcohol and edetate disodium 0.5 mg/mL]

Injection, solution, as phosphate: 150 mg/mL (2 mL, 4 mL, 6 mL, 60 mL)

Cleocin Phosphate®: 150 mg/mL (2 mL, 4 mL, 6 mL, 60 mL) [contains benzyl alcohol and edetate disodium 0.5 mg/mL]

Lotion, as phosphate: 1% (60 mL)

Cleocin T®, ClindaMax®: 1% (60 mL)

Pledgets, topical: 1% (60s, 69s)

Cleocin T®: 1% (60s) [contains isopropyl alcohol 50%]

ClindaReach™: 1% (120s) [contains isopropyl alcohol 50%; packaged as a kit containing 1 collapsible applicator, 64 appliques, and 64 unmedicated pads]

Solution, topical, as phosphate: 1% (30 mL, 60 mL)

Cleocin T®: 1% (30 mL, 60 mL) [contains isopropyl alcohol 50%]

Suppository, vaginal, as phosphate:

Cleocin® Vaginal Ovule: 100 mg (3s) [contains oleaginous base; single reusable applicator]

Generic AvailableYes: Excludes foam, granules, vaginal suppositories, vaginal cream
Pricing: U.S. (www.drugstore.com)

1% (60): $29.98

Mechanism of ActionReversibly binds to 50S ribosomal subunits preventing peptide bond formation thus inhibiting bacterial protein synthesis; bacteriostatic or bactericidal depending on drug concentration, infection site, and organism

Pharmacodynamics/Kinetics

Absorption: Topical: ~10%; Oral: Rapid (90%)

Distribution: High concentrations in bone and urine; no significant levels in CSF, even with inflamed meninges; crosses placenta; enters breast milk

Metabolism: Hepatic

Bioavailability: Topical: <1%

Half-life elimination: Neonates: Premature: 8.7 hours; Full-term: 3.6 hours; Adults: 1.6-5.3 hours (average: 2-3 hours)

Time to peak, serum: Oral: Within 60 minutes; I.M.: 1-3 hours

Excretion: Urine (10%) and feces (~4%) as active drug and metabolites

Dental Health Professional ConsiderationsClindamycin has not been shown to interfere with oral contraceptive activity; however, it reduces GI microflora, thus, oral contraceptive users should be advised to use additional methods of birth control. About 1% of clindamycin users develop pseudomembranous colitis. Symptoms may occur 2-9 days after initiation of therapy; however, it has never occurred with the 1-dose regimen of clindamycin used to prevent bacterial endocarditis.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsClindamycin may increase the duration of neuromuscular blockade after anesthesia. Clindamycin may also be considered in the prevention of bacterial endocarditis.

Anesthesia and Critical Care Concerns/Other ConsiderationsClindamycin may increase the duration of neuromuscular blockade after anesthesia. In adults, clindamycin injection can usually be dosed effectively on an every-8-hour basis.

Index TermsClindamycin Hydrochloride; Clindamycin Palmitate; Clindamycin Phosphate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(klye ok KWIN ole & floo METH a sone)
Canadian Brand NamesLocacorten® Vioform®
Pharmacologic CategoryAntibiotic, Topical; Corticosteroid, Topical
Use: Labeled IndicationsTreatment of corticosteroid-responsive dermatoses complicated by infection with bacterial and/or fungal agents
Dosing: Adults

Steroid-responsive otic infection: Otic solution (drops): Instill 2-3 drops into affected ear(s) 2 times/day; generally limit duration to 10 days

Steroid-responsive dermatoses/infection: Topical: Apply in a thin layer to affected area 2-3 times/day; generally limit duration to 7 days

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >2 years of age: Refer to adult dosing.
Administration: TopicalAvoid use of occlusive dressings. Cleanse affected area before application; can stain skin and fabrics; for external use only; avoid contact with eyes and mucous membranes.
StorageStore between 15°C and 30°C.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to clioquinol, flumethasone, or any component of the formulation; viral infection of the skin; tuberculosis, syphilis, rosacea, acne vulgaris, or perioral dermatitis; use in children <2 years of age
Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Iodine intolerance: Use with caution in patients with iodine intolerance.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Optic atrophy: Known to cause serious and irreversible optic atrophy.
- Peripheral neuropathy: Known to cause serious and peripheral neuropathy with muscular weakness, sensory loss, spastic paraparesis, and blindness.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid disease: Use with caution in patients with thyroid abnormalities.

Special populations:

- Pediatrics: Topical application poses a potential risk of toxicity to infants and children; striae and growth suppression have been reported with use of some corticosteroids in infants and children.

Other warnings/precautions:

- Application site: Do not apply to large areas or denuded skin; may irritate sensitized skin.
- Appropriate response: Discontinue therapy if no response within 1 week.

Pregnancy Risk FactorC (based on similar agents)
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Dermatologic: Skin irritation, rash, pigmentary changes, skin atrophy, striae

Endocrine: Potentially associated with excessive/prolonged use: Thyrotoxicosis, HPA axis suppression (rare)

Neuromuscular & skeletal: Peripheral neuropathy

Ocular: Optic atrophy

Drug InteractionsThere are no known significant interactions.
Test InteractionsThyroid function tests (decreased ^{131}I uptake); false-positive ferric chloride test for phenylketonuria
Monitoring ParametersObserve affected area for increased irritation
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Cream, topical (Locacorten® Vioform® [CAN]): Clioquinol 3% and flumethasone pivalate 0.02% (15 g, 50 g) [not available in the U.S.]

Solution, otic (Locacorten® Vioform® [CAN]): Clioquinol 1% and flumethasone pivalate 0.02% (10 mL) [not available in the U.S.]

Generic AvailableNo
Mechanism of ActionFlumethasone is a moderate-potency fluorinated corticosteroid; clioquinol chelates bacterial surface and trace metals needed for bacterial growth
Pharmacodynamics/Kinetics

Absorption: With an occlusive dressing, up to 40% of dose can be absorbed systemically during a 12-hour period; absorption is enhanced when applied under diapers

Half-life elimination: 11-14 hours

Excretion: Conjugated and excreted in urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsFlumethasone and Clioquinol; Iodochlorhydroxyquin and Flumethasone

Pronunciation(KLOE ba zam)

Canadian Brand NamesAlti-Clobazam; Apo-Clobazam®; Clobazam-10; Dom-Clobazam; Frisium®; Novo-Clobazam; PMS-Clobazam; ratio-Clobazam

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsAdjunctive treatment of epilepsy

Use: Unlabeled/InvestigationalMonotherapy for epilepsy or intermittent seizures

Dosing: AdultsAnticonvulsant: Oral: Initial: 5-15 mg/day; dosage may be gradually adjusted (based on tolerance and seizure control) to a maximum of 80 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAnticonvulsant: Oral:

<2 years: Initial 0.5-1 mg/kg/day

2-16 years: Initial: 5 mg/day; may be increased (no more frequently than every 5 days) to a maximum of 40 mg/day

Dosing: Hepatic ImpairmentAvoid use in severe hepatic impairment. Use lower doses in mild-to-moderate impairment and monitor closely.

Administration: OralMay be administered with food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to clobazam or any component of the formulation (cross sensitivity with other benzodiazepines may exist); myasthenia gravis; narrow-angle glaucoma; severe hepatic or respiratory disease; sleep apnea; history of substance abuse; use in pregnancy (particularly 1st trimester); breast-feeding is contraindicated per manufacturer

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Chronic use: Tolerance and loss of seizure control have been reported with chronic administration.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Pregnancy Risk FactorNot assigned; similar agents rated D. Contraindicated in 1st trimester (per manufacturer).

Pregnancy ConsiderationsClobazam crosses the placenta. Oral clefts reported with benzodiazepines, however, more recent data does not support an association between drug and oral clefts. Inguinal hernia, cardiac defects, spina bifida, dysmorphic facial features, skeletal defects, multiple other malformations also reported. Hypotonia and withdrawal symptoms reported following use during 3rd trimester or near time of delivery.

LactationEnters breast milk/contraindicated (AAP rates other benzodiazepines “of concern”); clinical effects on infant include sedation

Breast-Feeding ConsiderationsCrosses into breast milk. Clinical effects on the infant: Sedation. AAP reports that use of other benzodiazepines MAY BE OF CONCERN; manufacturer contraindicates use in breast-feeding.

Adverse Reactions

Central nervous system: Drowsiness (17%), ataxia (4%), dizziness (2%), behavior disorder (1%), confusion, depression, lethargy, slurred speech, tremor, anterograde amnesia. In addition, paradoxical reactions (including excitation, agitation, hallucinations, and psychosis) are known to occur with benzodiazepines.

Dermatologic: Rash, pruritus, urticaria

Gastrointestinal: Weight gain (2%); dose related: Xerostomia, constipation, nausea

Hematologic: Decreased WBCs and other hematologic abnormalities have been rarely associated with benzodiazepines

Neuromuscular & skeletal: Muscle spasm

Ocular: Blurred vision (1%)

Metabolism/Transport Effects**Substrate** (major) of CYP2C19 and 3A4

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin

[Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression). Concomitant administration may increase bioavailability of clobazam by 50%.

Food: Serum concentrations may be increased by grapefruit juice.

Herb/Nutraceutical: St John's wort may decrease benzodiazepine levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringFor inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions (see Adverse Reactions) at beginning of therapy and periodically with long-term use.

Patient EducationTake exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or sedatives) without consulting prescriber. Avoid grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Wear identification that you are taking an antiepileptic medication. Report excessive drowsiness, dizziness, fatigue, or impaired coordination; CNS changes (confusion, depression, increased sedation, excitation, headache, agitation, insomnia, or nightmares) or changes in cognition; respiratory difficulty or shortness of breath; changes in urinary pattern, changes in sexual activity; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances, excessive perspiration, or excessive GI symptoms (cramping, constipation, vomiting, anorexia); worsening of seizure activity, or loss of seizure control. **Pregnancy/breast-feeding precautions:** Discuss contraception with prescriber or inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended (contraindicated per manufacturer).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet: 10 mg

Alti-Clobazam [CAN], Apo-Clobazam® [CAN], Clobazam-10 [CAN], Dom-Clobazam [CAN], Frisium® [CAN], Novo-Clobazam [CAN], PMS-Clobazam [CAN], ration-Clobazam [CAN]: 10 mg [not available in the U.S.]

Generic AvailableYes

ManufacturerAventis Pharma (Canada)

Mechanism of ActionClobazam is a 1,5 benzodiazepine which binds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: 85% to 91%

Metabolism: Hepatic via N-dealkylation (likely via CYP) to active metabolite (N-desmethyl), and glucuronidation

Bioavailability: 87%

Half-life elimination: 18 hours; N-desmethyl (active): 42 hours

Time to peak: 15 minutes to 4 hours

Excretion: Urine (90%), as metabolites

Related Information

- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy Pearls Not available in U.S.
Clobazam is a 1,5 benzodiazepine; other benzodiazepines are typically 1,4 substituted.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Paradoxical reactions (including excitation, agitation, hallucinations, and psychosis) are known to occur with benzodiazepines.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health Comment In 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Medication Safety Issues

International issues:

Clobex® may be confused with Codex® which is a brand name for *Saccharomyces boulardii* in Italy

Pronunciation(kloe BAY ta sol)

U.S. Brand NamesClobevate® [DSC]; Clobex®; Cormax®; Olux-E™; Olux®; Temovate E®; Temovate®

Canadian Brand NamesClobex®; Dermovate®; Gen-Clobetasol; Novo-Clobetasol; Taro-Clobetasol

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsShort-term relief of inflammation of moderate-to-severe corticosteroid-responsive dermatoses (very high potency topical corticosteroid)

Use: DentalShort-term relief of oral mucosal inflammation

Dosing: Adults**Note:** Discontinue when control achieved; if improvement not seen within 2 weeks, reassessment of diagnosis may be necessary.

Oral mucosal inflammation (unlabeled use): Topical: Cream: Apply twice daily for up to 2 weeks (maximum dose: 50 g/week); discontinue application when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary

Steroid-responsive dermatoses: Topical:

Cream, emollient cream, gel, lotion, ointment: Apply twice daily for up to 2 weeks (maximum dose: 50 g/week)

Foam (Olux-E™): Apply to affected area twice daily for up to 2 weeks (maximum dose: 50 g/week); do not apply to face or intertriginous areas

Steroid-responsive dermatoses of the scalp: Topical: Foam (Olux®), solution: Apply to affected scalp twice daily for up to 2 weeks (maximum dose: 50 g or 50 mL/week)

Mild-to-moderate plaque-type psoriasis of nonscalp areas: Topical: Foam (Olux®): Apply to affected area twice daily for up to 2 weeks (maximum dose: 50 g/week); do not apply to face or intertriginous areas

Moderate-to-severe plaque-type psoriasis: Topical:

Emollient cream, lotion: Apply twice daily for up to 2 weeks, has been used for up to 4 weeks when application is <10% of body surface area; use with caution (maximum dose: 50 g/week)

Spray: Apply by spraying directly onto affected area twice daily; should be gently rubbed into skin. Should be used for not longer than 4 weeks; treatment beyond 2 weeks should be limited to localized lesions which have not improved sufficiently. Total dose should not exceed 50 g/week or 59 mL/week.

Scalp psoriasis: Topical: Shampoo: Apply thin film to dry scalp once daily; leave in place for 15 minutes, then add water, lather; rinse thoroughly

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Discontinue when control achieved; if improvement not seen within 2 weeks, reassessment of diagnosis may be necessary. Use in children <12 years is not recommended.

Oral mucosal inflammation (unlabeled use): Children ≥12 years: Topical: Refer to adult dosing.

Steroid-responsive dermatoses: Children ≥12 years: Topical: Refer to adult dosing.

Mild-to-moderate plaque-type psoriasis of nonscalp areas: Children ≥12 years: Topical: Refer to adult dosing.

Moderate-to-severe plaque-type psoriasis: Children ≥16 years: Topical: Refer to adult dosing.

Administration: Topical

Cream, gel, lotion, ointment, shampoo, solution: Apply the smallest amount that will cover affected area. Do not apply to face or intertriginous areas. Total dose should not exceed 50 g/week (or 50 mL/week of lotion, shampoo, or solution).

Foam: Turn can upside down and spray a small amount (golf-ball size) of foam into the cap or another cool surface. If the can is warm or foam is runny, place can under cold, running water. If fingers are warm, rinse with cool water and dry prior to handling (foam will melt on contact with warm skin). Massage foam into affected area.

Spray: Spray directly onto affected area of skin. Gently and completely rub into skin after spraying.

Storage

Cream, emollient cream, ointment: Store at room temperature, between 15°C to 30°C (59°F to 86°F). Do not refrigerate.

Foam: Store at room temperature; do not expose to temperatures >49°C (120°F). Avoid fire, flame, or smoking during and immediately following application.

Gel: Store between 2°C to 30°C (36°F to 86°F).

Lotion, shampoo, spray: Store at room temperature of 20°C to 25°C (68°F to 77°F). Spray is flammable; do not use near open flame.

Solution: Store between 4°C to 25°C (39°F to 77°F). Do not use near an open flame.

ContraindicationsHypersensitivity to clobetasol or any component of the formulation; viral, fungal, or tubercular skin lesions

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Use in children <12 years of age is not recommended.

Other warnings/precautions:

- Application site: Do not use on the face, axillae, or groin.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk FactorC

Pregnancy ConsiderationsExtensive use in pregnant women is not recommended. There are no adequate and well-controlled studies in pregnant women, however, teratogenic effects were observed in animal studies.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if topical application will result in detectable quantities in breast milk.

Adverse ReactionsFrequency not defined; may depend upon formulation used, length of application, surface area covered, and the use of occlusive dressings.

Endocrine & metabolic: Adrenal suppression, Cushing's syndrome, hyperglycemia

Local: Application site: Burning, cracking/fissuring of the skin, dryness, erythema, folliculitis, irritation, numbness, pruritus, skin atrophy, stinging, telangiectasia

Renal: Glucosuria

Effects reported with other high-potency topical steroids: Acneiform eruptions, allergic contact dermatitis, hypertrichosis, hypopigmentation, maceration of the skin, miliaria, perioral dermatitis, secondary infection

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersAdrenal suppression with extensive/prolonged use (ACTH stimulation test, morning plasma cortisol test, urinary free cortisol test)

Monitoring: Lab TestsAdrenal suppression with extensive/prolonged use (ACTH stimulation test, morning plasma cortisol test, urinary free cortisol test)

Patient EducationDo not overuse; use only as prescribed and for no longer than the period prescribed. Notify prescriber if condition being treated persists or worsens. Do not bandage or wrap affected area unless instructed to do so by prescriber. Wash hands after applying. Advise prescriber of the use of this medication if surgery is contemplated. This medication is for external use only; avoid use on face, underarms, or groin area unless specifically instructed to use in these areas by prescriber. Avoid contact with eyes or lips.

Cream, gel, lotion, ointment, solution: Apply the smallest amount that will cover affected area. Do not apply to face. A thin film is effective; apply sparingly and rub in lightly.

Foam: Turn can upside down and spray a small amount (golf-ball size) of foam into the cap or another cool surface. If the can is warm or foam is runny, place can under cold, running water. If fingers are warm, rinse with cool water and dry prior to handling (foam will melt on contact with warm skin). Gently massage foam into affected area until foam disappears.

Spray: Spray directly onto affected area of skin. Gently and completely rub into skin after spraying.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Medication Safety Issues

Sound-alike/look-alike issues:

Cloderm® may be confused with Clocort®

International issues:

Cloderm®: Brand name for clotrimazole in Germany

Pronunciation(kloe KOR toe lone)
U.S. Brand NamesCloderm®
Canadian Brand NamesCloderm®
Pharmacologic CategoryCorticosteroid, Topical
Use: Labeled IndicationsInflammation of corticosteroid-responsive dermatoses (intermediate-potency topical corticosteroid)
Dosing: AdultsSteroid responsive dermatoses: Topical: Apply sparingly and gently; rub into affected area from 1-4 times/day. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to clocortolone or any component of the formulation; viral, fungal, or tubercular skin lesions
Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Chronic use of corticosteroids in children may interfere with growth and development.

Pregnancy Risk FactorC
Adverse Reactions

1% to 10%:

Dermatologic: Itching, erythema

Local: Burning, dryness, irritation, papular rash

<1%: Hypertrichosis, acneiform eruptions, maceration of skin, skin atrophy, striae, hypopigmentation, perioral dermatitis, miliaria

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Patient EducationA thin film of cream is effective; do not overuse. Use only as prescribed, and for no longer than the period prescribed. Apply sparingly in light film and rub in lightly. Avoid contact with eyes. Notify prescriber if condition being treated persists or worsens. **Pregnancy precaution:** Inform prescriber if you are pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, as pivalate:

Cloderm®: 0.1% (30 g, 45 g, 90 g)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Cream (Cloderm)

0.1% (45): $96.08

Mechanism of ActionStimulates the synthesis of enzymes needed to decrease inflammation, suppress mitotic activity, and cause vasoconstriction

Pharmacodynamics/Kinetics

Absorption: Percutaneous absorption is variable and dependent upon many factors including vehicle used, integrity of epidermis, dose, and use of occlusive dressings; small amounts enter circulatory system via skin

Metabolism: Hepatic

Excretion: Urine and feces

Related Information

- Corticosteroids

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsClocortolone Pivalate

Jump To Field (Select Field Name)

Pronunciation(KLOE droh nate)

Canadian Brand NamesBonefos®; Clasteon®

Pharmacologic CategoryBisphosphonate Derivative

Use: Labeled IndicationsManagement of hypercalcemia of malignancy; management of osteolysis due to bone metastases of malignancy

Dosing: Adults

Hypercalcemia of malignancy:

I.V.:

Clasteon®

Single infusion: 1500 mg as a single dose

Multiple infusions: 300 mg/day; should not be prolonged beyond 10 days

Bonefos®: Multiple infusions: 300 mg/day; should not be prolonged beyond 7 days

Oral: Recommended daily maintenance dose following I.V. therapy:

Clasteon®: Range: 1600 mg (4 capsules) to 2400 mg (6 capsules) given in a single or 2 divided doses; maximum recommended daily dose: 3200 mg (8 capsules). Should be taken at least 1 hour before or after food since food may decrease clodronate absorption.

Bonefos®: Range: 1600 mg (4 capsules) to 2400 mg (6 capsules) given in single or 2 divided doses; maximum recommended daily dose: 3200 mg (8 capsules). Should be taken at least 2 hours before or after food since food may decrease clodronate absorption.

Osteolytic bone metastases:

I.V.:

Clasteon®:

Single infusion: 1500 mg as a single dose

Multiple infusions: 300 mg/day; should not be prolonged beyond 10 days

Bonefos®: Multiple infusions: 300 mg/day; should not be prolonged beyond 7 days

Oral:

Clasteon®: Recommended daily maintenance dose following I.V. therapy: Range: 1600 mg (4 capsules) to 2400 mg (6 capsules) given in a single or 2 divided doses; maximum recommended daily dose: 3200 mg (8 capsules). Should be taken at least 1 hour before or after food since food may decrease clodronate absorption.

Bonefos®: Initial: 1600 mg/day; may be increased to a maximum of 3200 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Clasteon®:

Serum creatinine (S_{cr}) >5 mg/dL: Use is contraindicated

S_{cr} ≥2.5-5 mg/dL: Dosage reduction is recommended; no specific guidelines available

Bonefos®:

S_{cr} >5 mg/dL: Use is contraindicated

Cl_{cr}: 50-80 mL/minute: Administer 75% to 100% of normal dose

Cl_{cr}: 12-49 mL/minute: Administer 50% to 75% of normal dose

Cl_{cr}: <12 mL/minute: Administer 50% of normal dose

Administration: I.V.Do not administer as bolus injection; for single infusion therapy administer over at least 4 hours; for multiple-infusion therapy administered once daily, infuse over 2-6 hours. Patients should be adequately hydrated with oral or I.V. fluids prior to infusion.

Administration: OralCapsules: Administer with a glass of plain water at least 2 hours (Bonefos®) or 1 hour (Clasteon®) before or after food.

StorageStore capsules and undiluted ampuls at room temperature (15°C to 30°C).

Clasteon®: Diluted solution should be infused within 12 hours of preparation.

Bonefos®: Diluted solution should be infused within 24 hours of preparation. Once diluted, Bonefos® may be stored up to 24 hours at room temperature.

ReconstitutionInjection must be diluted (in 500 mL of NS or D_5W).

CompatibilityStable in D_5W or 0.9% NS. **Incompatible** with calcium-containing solutions (eg, Ringer's solution).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to clodronate, bisphosphonates, or any component of the formulation; severe GI inflammation; renal impairment (serum creatinine >5 mg/dL, SI 440 µmol/L); concomitant use with other bisphosphonates; pregnancy or breast-feeding

Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition).

- Hypocalcemia: Risk of hypocalcemia (often asymptomatic) may be associated with both oral and intravenous use, however chelation of serum calcium observed with intravenous administration can further increase this risk. Interrupting the infusion or reducing the oral dose may be necessary. Correction of severe or symptomatic hypocalcemia may require calcium supplementation.

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Renal impairment: Dose reductions, close monitoring of serum creatinine and BUN, and adequate hydration are required with renal dysfunction. Use is contraindicated when serum creatinine >5 mg/dL, SI 440 µmol/L.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Injection: Dilute prior to use; adequate hydration should be ensured prior to infusion; avoid infiltration/extravasation. May cause hypocalcemia or transient hypophosphatemia. Do not give as bolus injection (may precipitate acute renal failure, severe local reactions, and thrombophlebitis). Monitor renal function during and after intravenous administration. Interrupt infusion in patients experiencing deteriorating renal function during therapy.

Pregnancy ConsiderationsBisphosphonates have been shown to cross the placenta and cause embryo/fetal effects in animals. Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. There are no adequate and well-controlled studies in pregnant women; use is contraindicated during pregnancy.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

>10%: Hepatic: Transaminases increased (≤18%; >2 x ULN: 2%)

1% to 10%:

Endocrine & metabolic: Hypocalcemia (≤3%)

Gastrointestinal: Vomiting (4%), nausea (≤3%), diarrhea (≤2%), anorexia (1%)

Renal: Serum creatinine increased (1%), BUN increased

<1%, postmarketing, and/or case reports: Alkaline phosphatase increased, bronchospasm, erythematous rash; hypersensitivity reactions (angioedema, pruritus, rash, urticaria); macropapular rash, mouth irritation, oliguria, osteonecrosis (primarily of jaw), parathyroid hormone increased, proteinuria, renal failure, ulcerative pharyngitis

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Estramustine: Clodronate may increase the serum concentration of Estramustine. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: All food and beverages may interfere with absorption. Coadministration with dairy products may decrease absorption. Beverages (especially orange juice and coffee), food, and medications (eg, antacids, calcium, iron, and multivalent cations) may reduce the absorption of bisphosphonates as much as 60%.

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Monitoring ParametersSerum electrolytes including calcium, phosphorous, magnesium, and potassium; monitor for hypocalcemia for at least 2 weeks after therapy; serum creatinine, BUN, CBC with differential, hepatic function

Reference RangeCalcium (total): Adults: 9.0-11.0 mg/dL (SI: 2.05-2.54 mmol/L), may slightly decrease with aging; Phosphorus: 2.5-4.5 mg/dL (SI: 0.81-1.45 mmol/L)

Nursing: Physical Assessment/MonitoringAssess history for any previous adverse response to bisphosphonates. Use caution with renal impairment. Correct any hypocalcemia prior to beginning treatment. Assess potential for interactions with other medications patient may be taking. Patients at risk for osteonecrosis (eg, chemotherapy or radiotherapy, corticosteroids, anemia, coagulopathy, poor oral hygiene) should have dental exams and necessary preventive dentistry should be done before beginning bisphosphonate therapy. Assess results of periodic laboratory tests, therapeutic effectiveness, and adverse reactions. Teach appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

I.V.: See specific directions.

Monitoring: Lab TestsSerum electrolytes including calcium, phosphorous, magnesium, and potassium; monitor for hypocalcemia for at least 2 weeks after therapy; serum creatinine, BUN, CBC with differential, hepatic function

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. Certain dental procedures should be avoided if possible while you are taking this medication; consult prescriber. You may experience temporary flatulence, bloating, nausea, or acid regurgitation (small, frequent meals may help); or temporary bone pain (consult prescriber for analgesic). Report persistent muscle or bone pain or leg cramps; acute headache; persistent gastric pain or unresolved GI upset; unusual fever; chills; difficulty swallowing; or pain in mouth, jaws, or teeth. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instructions on appropriate contraceptive measures. This drug may cause fetal defects. Do not breast-feed.

Oral: Take as directed, with a full glass of water on an empty stomach 2 hours before or 2 hours after eating or taking any other medications.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection:

Bonefos® [CAN]: 60 mg/mL (5 mL) [not available in the U.S.]

Clasteon® [CAN]: 30 mg/mL (10 mL) [not available in the U.S.]

Capsule:

Bonefos® [CAN], Clasteon® [CAN]: 400 mg [not available in the U.S.]

Mechanism of ActionA bisphosphonate which lowers serum calcium by inhibition of bone resorption via actions on osteoclasts or on osteoclast precursors.

Pharmacodynamics/Kinetics

Onset of effect: Within 48 hours

Peak effect: 5-7 days

Duration: 2-3 weeks

Absorption: Oral: Rapid but low absorption (~1% to 3%)

Distribution: V_d: ~20 L; 20% of absorbed clodronate is bound to bone

Protein binding: Variable (2% to 36%)

Bioavailability: Oral: 1% to 3%

Half-life elimination: Terminal: Oral: ~6 hours; I.V.: 13 hours (serum); prolonged in bone tissue

Time to peak, plasma: Oral: 30 minutes

Excretion: Urine (60% to 80% as unchanged drug); feces (as unabsorbed drug)

Dental Health Professional ConsiderationsNovartis Pharmaceuticals Corporation has notified dental health professionals of the risk of **osteonecrosis of the jaw (ONJ)** and the use of the bisphosphonates, pamidronate (Zometa®) and zoledronic acid (Aredia®): *"Dear Dental Health Professional" Letter Issued for Intravenous Bisphosphonates, Pamidronate and Zoledronic Acid, Regarding the Risk of Osteonecrosis of the Jaw (ONJ) in Cancer Patients* – May 2005.

Often observed in patients receiving chemotherapy and corticosteroids, reports of ONJ (the majority being associated with dental procedures) have been documented in cancer patients. Dental exams and preventative dentistry should be performed prior to placing patients with risk factors (chemotherapy, corticosteroids, poor oral hygiene) on intravenous bisphosphonate therapy. Additionally, invasive dental procedures should be avoided during therapy; patients developing ONJ while on bisphosphonate therapy should not have invasive dental procedures because the condition may be exacerbated. It has not been determined whether the discontinuation of bisphosphonate therapy in patients requiring dental surgery decreases the risk of ONJ. The treating healthcare professional is encouraged to assess the benefits and risks.

Bisphosphonates are widely used in the management of metastatic bone disease to treat hypercalcemia associated with malignancies and to treat osteoporosis. It is suggested that because of the trend in the use of chronic bisphosphonate therapy, the observation of an associated risk of osteonecrosis of the jaw should alert practitioners to monitor for this previously unrecognized potential complication.

Additional information is available at http://www.fda.gov/medwatch/SAFETY/2005/safety05.htm#zometa2, or by contacting Novartis Oncology Medical Services at 1-888-669-6682.

Estimates of Percent Incidence of ONJ in Treated Cancer Patients

Two reports have attempted to assess the percent of cancer patients developing ONJ after bisphosphonate treatment. Maerevoet et al, reported that among 194 patients treated with Zometa® every 3-4 weeks, nine developed ONJ. Before receiving Zometa®, six had received Aredia® 90 mg every 3-4 weeks. The median duration of treatment with Aredia® was 39 months and for Zometa® 18 months. The incidence of ONJ in these patients was calculated to be 4.6%. Durie et al, described the results of a survey by the International Myeloma Foundation in 2004 to assess the risk factors of ONJ. Out of 1203 respondents, 904 had myeloma and 299 breast cancer. Of the myeloma patients, 62 developed ONJ and 54 had suspicious findings. Of the breast cancer patients, 13 had ONJ and 23 had suspicious findings. The total number of cases of either ONJ or suspicious findings was 152. ONJ developed in 10% of 211 patients receiving Zometa® compared to 4% of 413 receiving Aredia®. The mean time to onset of ONJ among patients taking Zometa® was 18 months; the mean time to onset after Aredia® was 6 years. It should be noted that an early report by authors from Novartis Pharmaceuticals Corporation (Tarassoff, 2003) stressed that Aredia® and Zometa® had been used in 2.5 million patients world wide and reports of ONJ during their extensive use had been rare. In addition, these authors stated that review of the reported cases revealed multiple risk factors for avascular necrosis. McMahon et al, followed up with a report that, along with other factors, bisphosphonates are additional stressors of bone health that can tip the balance to osteonecrosis. They suggested that the prevention of ONJ should be stressed such as the elimination of chronic dental infections prior to chemotherapy and bisphosphonate use in cancer patients.

Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentBisphosphonates have been associated with renal toxicity manifested as deterioration of renal function and potential renal failure. Use caution in patients receiving lithium.

Index TermsClodronate Disodium

Medication Safety Issues

Sound-alike/look-alike issues:

Clofarabine may be confused with cladribine, cleVIDipine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(klo FARE a been)

U.S. Brand NamesClolar™

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite (Purine Antagonist)

Use: Labeled IndicationsTreatment of relapsed or refractory acute lymphoblastic leukemia

Use: Unlabeled/InvestigationalAdults: Relapsed and refractory acute myeloid leukemia (AML), chronic myeloid leukemia (CML) in blast phase, acute lymphocytic leukemia (ALL), myelodysplastic syndrome

Dosing: AdultsALL: Adults ≤21 years: I.V.: Refer to pediatric dosing.

Dosing: PediatricALL: Children and Adults 1-21 years: I.V.: 52 mg/m^2/day days 1 through 5; repeat every 2-6 weeks

Dosing: Renal ImpairmentSafety not established; use with caution.

Dosing: Hepatic ImpairmentSafety not established; use with caution.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Infuse over 2 hours. Continuous I.V. fluids are encouraged to decrease adverse events and tumor lysis effects. Hypotension may be a sign of capillary leak syndrome or systemic inflammatory response syndrome (SIRS). Discontinue if the patient becomes hypotensive during administration. Retreatment should only be considered if the hypotension is not related to capillary leak syndrome or SIRS.

Administration: I.V. DetailpH: 4.5-7.5

StorageStore undiluted and diluted solutions at room temperature of 15°C to 30°C (59°F to 86°F). Solutions diluted in 100-500 mL of D_5W or NS are stable for 24 hours at room temperature.

ReconstitutionClofarabine should be diluted with 100-500 mL NS or D_5W; manufacturer recommends the product be filtered through a 0.2 micrometer filter before dilution.

CompatibilityStable in D_5W or NS.

ContraindicationsHypersensitivity to clofarabine or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Myelosuppression (dose-dependent) is common.
- Systemic inflammatory response syndrome (SIRS)/capillary leak syndrome: Cytokine release may develop into systemic inflammatory response syndrome (SIRS)/capillary leak syndrome, and organ dysfunction; discontinuation should be considered with the presentation of SIRS or capillary leak syndrome.
- Tumor lysis syndrome: With use, tumor lysis syndrome may occur (see Tumor Lysis Syndrome)..

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; safety and efficacy have not been established.
- Renal impairment: Use with caution in patients with renal impairment; safety and efficacy have not been established.

Special populations:

- Adults: Safety and efficacy have not been established in adults >21 years of age.
- Pediatrics: Safety and efficacy have not been established in children <1 year of age

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects were observed in animal studies. There are no adequate or well-controlled studies in pregnant women. Women of childbearing potential should be advised to use effective contraception and avoid becoming pregnant during therapy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Pericardial effusion (35%), tachycardia (34%), hypotension (29%), left ventricular systolic dysfunction (27%), edema (20%), flushing (18%), hypertension (11%)

Central nervous system: Headache (46%), pyrexia (41%), fatigue (36%) anxiety (22%), pain (19%), dizziness (16%), depression (11%), irritability (11%), lethargy (1%)

Dermatologic: Pruritus (47%), dermatitis (41%), petechiae (29%), erythema (18%), palmar-plantar erythrodysesthesia syndrome (13%), oral candidiasis (13%), cellulitis (11%)

Gastrointestinal: Vomiting (83%), nausea (75%), diarrhea (53%), abdominal pain (36%), anorexia (30%), constipation (21%), mucosal inflammation (18%), gingival bleeding (15%), sore throat (14%), appetite decreased (11%)

Genitourinary: Hematuria (17%)

Hematologic: Febrile neutropenia (57%)

Hepatic: ALT increased (44%), AST increased (38%), bilirubin increased (15%), hepatomegaly (15%), jaundice (15%)

Neuromuscular & skeletal: Rigors (38%), pain in limb (29%), myalgia (14%), back pain (13%), arthralgia (11%)

Respiratory: Epistaxis (31%), cough (19%), respiratory distress (14%), dyspnea (13%)

Miscellaneous: Infection (85%), injection site pain (14%), staphylococcal infection (13%), herpes simplex (11%)

1% to 10%:

Central nervous system: Somnolence (10%)

Gastrointestinal: Weight gain (10%)

Genitourinary: Creatinine increased (6%)

Neuromuscular & skeletal: Tremor (10%)

Respiratory: Pleural effusion (10%), pneumonia (10%), systemic inflammatory response syndrome (SIRS)/capillary leak syndrome

Miscellaneous: Transfusion reaction (10%), bacteremia (10%)

Oncology: VesicantNo

Oncology: Emetic PotentialHigh (60% to 90%)

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, cardiac function, and respiratory status during infusion; periodic CBC with platelet count (increase frequency in patients who develop cytopenias); liver and kidney function during 5 days of clofarabine administration; signs and symptoms of tumor lysis syndrome and cytokine release syndrome (tachypnea, tachycardia, hypotension, pulmonary edema); hydration status

Nursing: Physical Assessment/MonitoringAssess other prescriptions, OTCs, or biologicals patient is taking; drugs with known renal or hepatic toxicity should be avoided and renal/hepatic function monitored closely during 5 days of Clolar™ administration. Evaluate laboratory test results at regular intervals during therapy. Monitor for signs of potential systemic inflammatory response syndrome, capillary leak syndrome, and organ dysfunction (eg, tachypnea, tachycardia, hypotension, pulmonary edema - respiratory status, cardiac status, and blood pressure must be closely monitored during infusion). Maintaining adequate hydration with I.V. fluids during administration periods may reduce these and other adverse reactions (see Warnings/Precautions.) Patient should be monitored closely for other adverse reactions on a regular basis for duration of therapy (see Adverse Reactions). Teach patient/caregiver possible side effects, appropriate interventions, adverse symptoms to report, and pregnancy precautions (see Patient Education.)

Patient EducationThis drug can only be administered by intravenous infusion; you will be monitored closely during and following infusions. Immediately report any burning, pain, or swelling at infusion site; any unusual chest pain or tightness, rapid heart beat or palpitations; difficulty breathing; difficulty swallowing; nausea or vomiting; or other adverse symptoms during infusion. Do not take any new medications during therapy without consulting prescriber. You will be more susceptible to infection (avoid crowds and exposure to infection; do not have any vaccinations unless approved by prescriber). It is important that you maintain adequate nutrition and fluid intake; if you experience nausea, vomiting, or loss of appetite, frequent fluid intake and small frequent meals may help. You may experience diarrhea (boiled milk, yogurt may help) or constipation (increased dietary fiber or fluid may help). Report any signs of dehydration (dizziness, lightheadedness, fainting spells, or decreased urine output); chest pain, palpitations, rapid heart beat, swelling of extremities, acute headache or flushing; difficulty breathing or nosebleeds; persistent gastrointestinal upset; signs of infection (fever, sore throat, runny nose, white plaques in mouth, vaginal or rectal discharge); unusual anxiety, depression, irritability, fatigue, or lethargy; new skin rash, eruption, or redness; unusual limb, back, or muscle pain or tremor; change in color or frequency of urine or blood in urine; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. This drug may cause fetal deformities or loss of pregnancy; consult prescriber for appropriate contraceptives. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 1 mg/mL (20 mL)

Generic AvailableNo

ManufacturerAAI Development Services; Genzyme Corp

Mechanism of ActionClofarabine, a purine (deoxyadenosine) nucleoside analog, is metabolized to clofarabine 5'-triphosphate. Clofarabine 5'-triphosphate decreases cell replication and repair as well as causing cell death. To decrease cell replication and repair, clofarabine 5'-triphosphate competes with deoxyadenosine triphosphate for the enzymes ribonucleotide reductase and DNA polymerase. Cell replication is decreased when clofarabine 5'-triphosphate inhibits ribonucleotide reductase from reacting with deoxyadenosine triphosphate to produce deoxynucleotide triphosphate which is needed for DNA synthesis. Cell replication is also decreased when clofarabine 5'-triphosphate competes with DNA polymerase for incorporation into the DNA chain; when done during the repair process, cell repair is affected. To cause cell death, clofarabine 5'-triphosphate alters the mitochondrial membrane by releasing proteins, an inducing factor and cytochrome C.

Pharmacodynamics/Kinetics

Distribution: V_d: 172 L/m^2

Protein binding: 47%

Metabolism: Intracellulary by deoxycytidine kinase and mono- and diphosphokinases to active metabolite clofarabine 5′-triphosphate

Half-life elimination: ~5.2 hours

Excretion: Urine (49% to 60% unchanged)

Related Information

- Tumor Lysis Syndrome

Pharmacotherapy PearlsThe use of prophylactic steroids (hydrocortisone 100 mg/m^2 on days 1-3) may be of benefit in preventing signs of SIRS or capillary leak syndrome; allopurinol may be used if hyperuricemia is anticipated. Dosage should be based on BSA, calculated based upon height and weight prior to each cycle.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucosal inflammation and gingival bleeding.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, depression, irritability, and lethargy

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, lithium, valproic acid may produce additive effects.

Index TermsClofarex; NSC606869

Medication Safety Issues

Sound-alike/look-alike issues:

ClomiPHENE may be confused with clomiPRAMINE, clonidine

Clomid® may be confused with clonidine

Serophene® may be confused with Sarafem™

Pronunciation(KLOE mi feen)

U.S. Brand NamesClomid®; Serophene®

Canadian Brand NamesClomid®; Milophene®; Serophene®

Pharmacologic CategoryOvulation Stimulator; Selective Estrogen Receptor Modulator (SERM)

Use: Labeled IndicationsTreatment of ovulatory failure in patients desiring pregnancy

Dosing: AdultsOvulation induction: Oral: Females:

Initial course: 50 mg once daily for 5 days. Begin on or about the fifth day of cycle if progestin-induced bleeding is scheduled or spontaneous uterine bleeding occurs prior to therapy.

Dose adjustment: Subsequent doses may be increased to 100 mg once daily for 5 days only if ovulation does not occur at the initial dose. A low dose or duration of course is recommended in patients where unusual sensitivity to pituitary gonadotropin is suspected (eg, PCOS).

Repeat courses: If needed, the 5-day cycle may be repeated as early as 30 days after the previous one. Exclude the presence of pregnancy.

Maximum dose: 100 mg once daily for 5 days for 6 cycles. Discontinue if ovulation does not occur after 3 courses of treatment; or if 3 ovulatory responses occur but pregnancy is not achieved. Re-evaluate if menses does not occur following ovulatory response. Doses larger than 150 mg have been reported, however, pregnancy rates are low.

Dosing: ElderlyRefer to adult dosing.

Administration: OralThe total daily dose should be taken at one time to maximize effectiveness.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light, heat, and excessive humidity.

ContraindicationsHypersensitivity to clomiphene citrate or any of its components; liver disease; abnormal uterine bleeding; enlargement or development of ovarian cyst (not due to polycystic ovarian syndrome); uncontrolled thyroid or adrenal dysfunction; presence of an organic intracranial lesion such as pituitary tumor; pregnancy

Allergy Considerations

- ClomiPHENE Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Ovarian enlargement: May be accompanied by abdominal distention or abdominal pain and generally regresses without treatment within 2-3 weeks. Do not continue dosing until ovaries are of normal size.
- Ovarian hyperstimulation syndrome (OHSS): OHSS is characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If severe hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly within 24 hours to several days and generally occurs during the 7-10 days immediately following treatment.
- Visual disturbances: Blurring or other visual symptoms can occur; patients with visual disturbances should discontinue therapy and have an eye exam.

Disease-related concerns:

- Polycystic ovarian syndrome (PCOS): Use with caution in patients unusually sensitive to pituitary gonadotropins (eg, POS).

Other warnings/precautions:

- Appropriate use: To minimize risks, use only at the lowest effective dose.
- Multiple births: May result from the use of these medications; advise patient of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsEmbryotoxic effects were observed in animal studies. The incidence of adverse fetal effects following maternal use of clomiphene for ovulation induction is similar to those seen in the general population. Clomiphene is not indicated for use in women who are already pregnant.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsClomiphene may decrease lactation.

Adverse Reactions

>10%: Endocrine & metabolic: Ovarian enlargement (14%)

1% to 10%:

Central nervous system: Headache (1%)

Endocrine & metabolic: Hot flashes (10%), breast discomfort (2%), abnormal uterine bleeding (1%)

Gastrointestinal: Distention/bloating/discomfort (6%), nausea (2%), vomiting (2%)

Ocular: Visual symptoms (2%, includes blurring of vision, diplopia, floaters, lights, phosphenes, photophobia, scotomata, waves)

<1%: Acute abdomen, alopecia, appetite increased, constipation, depression, dermatitis, diarrhea, dizziness, dry hair, fatigue, insomnia, lightheadedness, nervousness, rash, urinary frequency/volume increased, vaginal dryness, vertigo, weight gain/loss

Postmarketing/case reports (limited to important or life-threatening): Abnormal accommodation, acne, allergic reaction, arrhythmia, chest pain, edema, endometriosis, erythema multiforme, erythema nodosum, eye pain, fever, hypertension, hypertrichosis, macular edema, migraine, mood changes, neoplasms, optic neuritis, ovarian cyst, ovarian hemorrhage, palpitation, PE, pruritus, retinal hemorrhage, retinal thrombosis, seizure, stroke, syncope, tachycardia, temporary loss of vision, thrombophlebitis, thyroid disorder, tinnitus, transaminase increased, tubal pregnancy, uterine hemorrhage

Drug InteractionsThere are no known significant interactions.

Test InteractionsClomiphene may increase levels of serum thyroxine and thyroxine-binding globulin (TBG)

Monitoring ParametersBasal body temperature, serum progesterone, urinary luteinizing hormone; follicular growth and endometrial thickness may be useful in some cases; pregnancy test prior to repeat courses

Reference RangeSerum progesterone: Ovulation generally occurs with levels ≥3 ng/mL; best results with levels >10 ng/mL

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse response regularly during therapy. Teach patient proper use (eg, measuring basal body temperature and timing intercourse), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Breast-feeding is contraindicated.

Monitoring: Lab TestsBasal body temperature, serum progesterone, urinary luteinizing hormone; pregnancy test prior to repeat courses

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. There may be a risk of multiple pregnancies with therapy. Do not take any new medication during therapy unless approved by prescriber. Follow recommended schedule of dosing exactly. May cause hot flashes (cool clothes and cool environment may help). Report acute sudden headache; respiratory difficulty; warmth, swelling, pain, or redness in calves; breast enlargement (male) or breast discomfort (female); abnormal menstrual bleeding; vision changes (blurring, diplopia, photophobia, floaters); acute abdominal discomfort; or fever. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as citrate [scored]: 50 mg

Clomid®, Serophene®: 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Clomid)

50 mg (5): $75.94

Tablets (ClomiPHENE Citrate)

50 mg (30): $84.99

Tablets (Serophene)

50 mg (5): $55.38

Mechanism of ActionClomiphene is a racemic mixture consisting of zuclomiphene (~38%) and enclomiphene (~62%), each with distinct pharmacologic properties. Enclomiphene is much less potent in inducing ovulation; however, it is more rapidly absorbed and metabolized, allowing the more potent activity of zuclomiphene to predominate. Zuclomiphene acts at the level of the hypothalamus, occupying cell surface and intracellular estrogen receptors (ERs) for longer durations than estrogen. This interferes with receptor recycling, effectively depleting hypothalamic ERs and inhibiting normal estrogenic negative feedback. Impairment of the feedback signal results in increased pulsatile GnRH secretion from the hypothalamus and subsequent pituitary gonadotropin (FSH, LH) release, causing growth of the ovarian follicle, followed by follicular rupture.

Pharmacodynamics/Kinetics

Onset: Ovulation: 5-10 days following course of treatment

Duration: Effects are cumulative; ovulation may occur in the cycle following the last treatment

Metabolism: Hepatic; undergoes enterohepatic recirculation

Half-life elimination: 5-7 days

Time to peak, plasma: ~6 hours

Excretion: Primarily feces; urine (small amounts)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause insomnia, fatigue, or depression
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsClomiphene Citrate

ClomiPRAMINE

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

ClomiPRAMINE may be confused with chlorproMAZINE, cleVIDipine, clomiPHENE, desipramine, Norpramin®

Anafranil® may be confused with alfentanil, enalapril, nafarelin

Pronunciation(kloe MI pra meen)

U.S. Brand NamesAnafranil®

Canadian Brand NamesAnafranil®; Apo-Clomipramine®; CO Clomipramine; Gen-Clomipramine

Pharmacologic CategoryAntidepressant, Tricyclic (Tertiary Amine)

Use: Labeled IndicationsTreatment of obsessive-compulsive disorder (OCD)

Use: Unlabeled/InvestigationalDepression, panic attacks, chronic pain

Dosing: Adults**Treatment of OCD:** Oral: Initial: 25 mg/day; may gradually increase as tolerated over the first 2 weeks to 100 mg/day in divided doses; Maintenance: May further increase to recommended maximum of 250 mg/day; may give as a single daily dose at bedtime once tolerated

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Treatment of OCD:** Oral: Children >10 years: Initial: 25 mg/day and gradually increase, as tolerated, to a maximum of 3 mg/kg/day or 200 mg/day, whichever is smaller. **Note:** The safety and efficacy of clomipramine in pediatric patients <10 years of age have not been established and, therefore, dosing recommendations cannot be made.

Administration: OralDuring titration, may divide doses and administer with meals to decrease gastrointestinal side effects. After titration, may administer total daily dose at bedtime to decrease daytime sedation.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to clomipramine, other tricyclic agents, or any component of the formulation; use of MAO inhibitors within 14 days; use in a patient during the acute recovery phase of MI

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Clomipramine is FDA approved for the treatment of OCD in children ≥10 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Clomipramine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is very high relative to other antidepressants.

- Hematologic effects: TCAs may rarely cause bone marrow suppression; monitor for any signs of infection and obtain CBC if symptoms (eg, fever, sore throat) evident.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is moderate relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is very high relative to other antidepressants.

- Seizures: May cause seizures (relationship to dose and/or duration of therapy); do not exceed maximum doses. Use with caution in patients with a previous seizure disorder or condition predisposing to seizures such as brain damage, alcoholism, or concurrent therapy with other drugs which lower the seizure threshold.

- Sexual dysfunction: Has been associated with a high incidence of male sexual dysfunction.

- Weight gain: May cause weight gain.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk of conduction abnormalities with this agent is high relative to other antidepressants.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation due to concerns of pro-arrhythmogenesis.

Concurrent drug therapy issues:

- Anticholinergic and/or neuroleptic agents: Hyperpyrexia has been observed with TCAs in combination with anticholinergics and/or neuroleptics, particularly during hot weather.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Recommended to discontinue prior to elective surgery requiring general anesthesia. Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsNot approved as an antidepressant, clomipramine's anticholinergic and hypotensive effects limit its use versus other preferred antidepressants. Elderly patients were found to have higher dose-normalized plasma concentrations as a result of decreased demethylation (decreased 50%) and hydroxylation (25%).

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Withdrawal symptoms (including dizziness, nausea, vomiting, headache, malaise, sleep disturbance, hyperthermia, and/or irritability) have been observed in neonates whose mothers took clomipramine up to delivery. Use in pregnancy only if the benefits to the mother outweigh the potential risks to the fetus.

LactationEnters breast milk/not recommended (AAP rates "of concern")

Breast-Feeding ConsiderationsGenerally, it is not recommended to breast-feed if taking antidepressants because of the long half-life, active metabolites, and the potential for side effects in the infant.

Adverse ReactionsData shown for children reflects both children and adolescents studied in clinical trials.

>10%:

Central nervous system: Dizziness (54%), somnolence (54%), drowsiness, headache (52%; children 28%), fatigue (39%), insomnia (25%; children 11%), malaise, nervousness (18%; children 4%)

Endocrine & metabolic: Libido changes (21%), hot flushes (5%)

Gastrointestinal: Xerostomia (84%, children 63%) constipation (47%; children 22%), nausea (33%; children 9%), dyspepsia (22%; children 13%), weight gain (18%; children 2%), diarrhea (13%; children 7%), anorexia (12%; children 22%), abdominal pain (11%), appetite increased (11%)

Genitourinary: Ejaculation failure (42%), impotence (20%), micturition disorder (14%; children 4%)

Neuromuscular & skeletal: Tremor (54%), myoclonus (13%; children 2%), myalgia (13%)

Ocular: Abnormal vision (18%; children 7%)

Respiratory: Pharyngitis (14%), rhinitis (12%)

Miscellaneous: Diaphoresis increased (29%; children 9%)

1% to 10%:

Cardiovascular: Flushing (8%), postural hypotension (6%), palpitation (4%), tachycardia (4%; children 2%), chest pain (4%), edema (2%)

Central nervous system: Anxiety (9%), memory impairment (9%), twitching (7%), depression (5%), concentration impaired (5%), fever (4%), hypertonia (4%), abnormal dreaming (3%), agitation (3%), confusion (3%), migraine (3%), pain (3%), psychosomatic disorder (3%), speech disorder (3%), yawning (3%), aggressiveness (children 2%), chills (2%), depersonalization (2%), emotional lability (2%), irritability (2%), panic reaction (1%)

Endocrine & metabolic: Amenorrhea (1%), breast enlargement (2%), breast pain (1%), hot flashes (5%), lactation (nonpuerperal) (4%)

Gastrointestinal: Taste disturbance (8%), vomiting (7%), flatulence (6%), tooth disorder (5%), dysphagia (2%), esophagitis (1%)

Genitourinary: UTI (2% to 6%), micturition frequency (5%), dysuria (2%), leucorrhea (2%), vaginitis (2%), urinary retention (2%)

Neuromuscular & skeletal: Paresthesia (9%), back pain (6%), arthralgia (3%), paresis (children 2%), weakness (1%)

Ocular: Lacrimation abnormal (3%), mydriasis (2%), conjunctivitis (1%)

Otic: Tinnitus (6%)

Respiratory: Sinusitis (6%), coughing (6%), bronchospasm (2%; children 7%), epistaxis (2%)

<1% (Limited to important or life-threatening): Accommodation abnormal, albuminuria, aneurysm, anticholinergic syndrome, aphasia, apraxia, arrhythmia, ataxia, atrial flutter, blepharitis, blood in stool, bradycardia, breast fibroadenosis, bronchitis, bundle branch block, cardiac arrest, cardiac failure, catalepsy, cellulitis, cerebral hemorrhage, cervical dysplasia, cheilitis, cholinergic syndrome, choreoathetosis, chromatopsia, chronic enteritis, coma, conjunctival hemorrhage, cyanosis, deafness, dehydration, delirium, delusion, diabetes mellitus, diplopia, dyskinesia, dysphonia, dystonia, EEG abnormal, encephalopathy, endometrial hyperplasia, endometriosis, epididymitis, erythematous rash, exophthalmos, extrapyramidal disorder, extrasystoles, gastric ulcer, generalized spasm, glaucoma, glycosuria, goiter, gynecomastia, hallucinations, heart block, hematuria, hemiparesis, hemoptysis, hepatitis, hostility, hyperacusis, hypercholesterolemia, hyper-/hypoesthesia, hyperglycemia, hyper-/hypokinesia, hyperreflexia, hyper-/hypothyroidism, hyperuricemia, hyper-/hypoventilation, hypnagogic hallucination, hypokalemia, ideation, intestinal obstruction, irritable bowel syndrome, keratitis, laryngismus, leukemoid reaction, lupus erythematosus rash, lymphadenopathy, lymphoma-like disorder, maculopapular rash, manic reaction, marrow depression, myocardial infarction, myocardial ischemia, myopathy, myositis, neuralgia, neuropathy, oculogyric crisis, oculomotor nerve paralysis, oral/pharyngeal edema, ovarian cyst, paralytic ileus, paranoia, parosmia, peptic ulcer, peripheral ischemia, phobic disorder, photophobia, photosensitivity reaction, pneumonia, polyarteritis nodosa, premature ejaculation, psychosis, pyelonephritis, pyuria, rectal hemorrhage, renal calculus, renal cyst, schizophrenic reaction, scleritis, seizure, sensory disturbance, skin ulceration, strabismus, stupor, suicidal ideation, suicide, suicide attempt, thrombophlebitis, tongue ulceration, tooth caries, torticollis, urinary incontinence, uterine hemorrhage, uterine inflammation, vaginal hemorrhage, vasospasm, ventricular tachycardia, visual field defect, withdrawal syndrome

Metabolism/Transport Effects **Substrate** of CYP1A2 (major), 2C19 (major), 2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (moderate)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Aspirin: Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the serum concentration of ClomiPRAMINE. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Serum concentrations/toxicity may be increased by grapefruit juice.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava.

Test InteractionsIncreased glucose

Monitoring ParametersPulse rate and blood pressure prior to and during therapy; ECG/cardiac status in older adults and patients with cardiac disease; suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)
